WATER QUALITY FACT BOOK 1986

Ohio River Valley Water Sanitation Commission

MEMBERS OF THE COMMISSION *

ILLINOIS

Richard J. Carlson, Director, Illinois Environmental Protection Agency
Richard S. Engelbrecht, Ph.D., Professor of Environmental Engineering,
University of Illinois
Cordell McGoy, Correctional Lieutenant, Vienna Correctional Center

INDIANA

Joseph H. Harrison, Attorney, Bowers, Harrison, Kent & Miller
Albert R. Kendrick, Jr., Safety & Environmental Protection Superintendent,
Monsanto Company
Nancy A. Maloley, Commissioner, Indiana Department of Environmental Management

KENTUCKY

Charlotte E. Baldwin, Secretary, Natural Resources and Environmental Protection
Cabinet
Gordon R. Garner, Executive Director, Louisville & Jefferson County Metropolitan
Sewer District
Ted R. Richardson, P.E., Cardinal Engineering Corporation

NEW YORK

Thomas A. Storch, Ph.D., Director, Environmental Resources Center, SUNY-Fredonia
Henry G. Williams, Commissioner, Department of Environmental Conservation
Vacant

OHIO

Lloyd N. Clausing, Consultant, Portsmouth
Pasquale V. Scarpino, Ph.D., Professor of Environmental Engineering, University
of Cincinnati
Warren W. Tyler, Director, Ohio Environmental Protection Agency

PENNSYLVANIA

Nicholas DeBenedictis, Secretary, Department of Environmental Resources
Paul Emler, Jr., Director of Field Operations, Living Lakes, Inc.
Gerald C. Smith, System Company President, American Water Works Service Company

VIRGINIA

Joseph S. Cragwall, State Water Control Board
Millard B. Rice, State Water Control Board
Robert C. Wininger, State Water Control Board

WEST VIRGINIA

Edgar N. Henry, Director, Water Development Authority
David K. Heydinger, M.D., State Director of Health
David W. Robinson, Chief, Division of Water Resources, Department of Natural
Resources

UNITED STATES

Jean M. Barren
Joseph D. Cloud
Jack E. Ravan, Regional Administrator, U.S. EPA Region IV

*** As of April 1, 1986**

OFFICERS

Paul Emler, Jr., Chairman
Joseph H. Harrison, Vice Chairman
Thomas A. Storch, Secretary/Treasurer
Leo Weaver, Executive Director and Chief Engineer

LEGAL COUNSEL

OHIO RIVER WATER QUALITY FACT BOOK

A Compendium of Information for Use in Water Quality
Analysis of the Ohio River

OHIO RIVER VALLEY WATER SANITATION COMMISSION
49 East Fourth Street, Suite #815
Cincinnati, Ohio 45202

April, 1986

FOREWORD

This book contains information on the Ohio River, its tributaries, and its drainage basin which has been assembled for use in water quality analysis. Many factors, both natural and man made, affect the quality of the water of the Ohio. In order to interpret the results of water quality studies, it is necessary to have some understanding of these factors. Much of the information presented herein is available in other Commission documents; the objective in preparing this book is to establish a single, accessible source of information for use in water quality analysis of the Ohio River.

The information is divided into four sections: Hydrology, Land Use, Water Use, and Water Quality. It is intended that this will be a dynamic document with periodic updating and supplementation as new information becomes available. Users of the document are encouraged to suggest other information for inclusion in subsequent editions.

In addition to Commission sources, much of the information has been developed by other agencies actively concerned with the Ohio River. These include the U.S. Army Corps of Engineers, the U.S. Geological Survey and the water pollution control agencies of the six states along the Ohio River--Illinois, Indiana, Kentucky, Ohio, Pennsylvania, and West Virginia.

Acknowledgement is due Senior Environmental Engineer Peter A. Tennant of the Commission staff who was principally responsible for the compilation of the "Fact Book."

Leo Weaver
Executive Director

TABLE OF CONTENTS

<u>Item</u>	<u>Page</u>
Section I: Hydrology.....	I-1
United States Geological Survey Stream Flow Gages - Ohio River Main Stem.....	I-5
Ohio River Navigation Dams.....	I-6
Primary Tributaries to the Ohio River.....	I-7
Corps of Engineers Reservoirs in the Ohio River Basin Which Provide Flow Augmentation.....	I-9
Annual Climatic Data for Selected Cities - Ohio River Basin.....	I-11
Monthly Air Temperatures at Selected Cities - Ohio River Basin.....	I-12
Precipitation in Selected Cities - Ohio River Basin.....	I-13
Sunshine and Wind in Selected Cities - Ohio River Basin.....	I-14
Average Annual Evaporative Loss from the Ohio River by Navigation Pool.....	I-15
Critical Flows and Discharge Quantities.....	I-16
Ohio River Velocity-Mile Point Relationships.....	I-17
Ohio River Channel Geometry.....	I-18
Section II: Land Use.....	II-1
Land Use in Drainage Areas of Ohio River Locations.....	II-3
Land Use in Major Ohio River Tributary Basins... II-4	
Land Use by Segment - Ohio River and Minor Tributaries.....	II-5
Land Area and Population within the Ohio River Basin - ORSANCO Compact States.....	II-6
Population of Cities in Ohio River Basin, 1970 and 1980.....	II-7
Standard Metropolitan Statistical Area Population, 1970 and 1980.....	II-8
River Mile Points of County Lines.....	II-9
Section III: Water Use.....	III-1
Summary of Ohio River Segments.....	III-9
Ohio River Municipal Water Supply Intakes.....	III-10
Industrial Water Intakes on the Ohio River Main Stem.....	III-11
List of Power Generating Facilities.....	III-15
Municipal Discharges to the Ohio River.....	III-17
Industrial Wastewater Discharges to the Ohio River.....	III-20
River Terminals Handling Petroleum Products and Hazardous Chemicals.....	III-32
Communities with Combined Sewer Systems.....	III-41

<u>Item</u>	<u>Page</u>
Section IV: Water Quality.....	IV-1
Commission Monitoring Locations and STORET	
Station Codes.....	IV-4
State Sampling Locations in the Ohio River Basin.....	IV-6
United States Geological Survey National Stream Quality Accounting Network Stations - Ohio River and Primary Tributaries.....	IV-13
Average Monthly Stream Flow - Ohio River Electronic Monitors.....	IV-14
Minimum Monthly Average Stream Flow - Ohio River Electronic Monitors.....	IV-15
Average Monthly Stream Flow - Ohio River Tributary Electronic Monitors.....	IV-16
Minimum Monthly Average Flow - Ohio River Tributary Electronic Monitors.....	IV-17
Average Monthly Temperature - Ohio River Electronic Monitors.....	IV-18
Maximum Monthly Average Temperature - Ohio River Electronic Monitors.....	IV-19
Average Monthly Temperature - Ohio River Tributary Electronic Monitors.....	IV-20
Maximum Monthly Average Temperature - Ohio River Tributary Electronic Monitors.....	IV-21
Average Monthly Specific Conductance - Ohio River Electronic Monitors.....	IV-22
Average Monthly Specific Conductance - Ohio River Tributary Electronic Monitors.....	IV-23

Appendices:

A: Conversion Factors for Water Quality Analysis	A1
B: Ohio River Valley Water Sanitation Commission Pollution Control Standards.	B1
C: Directory of State Water Pollution Control Agencies.....	C1

Figure I: Ohio River Basin with Major Tributary Watersheds.....	I-4
Figure II: Ohio River Basin - Principal Cities.....	II-2
Figure III: Municipal Water Intakes and Wastewater Discharges of Two MGD or Greater.....	III-3
Figure IV: Commission Monitoring Locations.....	IV-3

SECTION I: HYDROLOGY

Hydrology is the branch of science dealing with the distribution of water on the surface of the earth and underground and with the cycle involving precipitation, evaporation and flow. For purposes of water quality analysis of rivers, the most important hydrologic factor is stream flow in terms of quantity and velocity. The quantity of flow in a river is a function of the amount of precipitation falling on the drainage basin and the runoff characteristics of the basin. Seasonal variations in precipitation result in similar variations in stream flow. In the Ohio River, flow is also influenced by operations of the Corps of Engineers which are undertaken to maintain year-round navigation on the river.

Long-term records of stream flow are maintained by the U.S. Geological Survey which operates gages on streams throughout the country. Twelve gages are operated on the Ohio River.

Navigation dams on the Ohio River have a significant impact on the velocity of the stream. The modern high lift dams have resulted in a deeper, slower moving river than existed previously. This could mean several changes in water quality: settling of certain materials would increase, resulting in lower turbidity, while atmospheric reaeration would decrease, resulting in lower dissolved oxygen. The year in which each high lift dam was constructed is therefore critical information in the interpretation of historic water quality data.

Most of the Ohio River Basin is drained by tributaries; less than five percent of the basin drains directly to the main stem. The runoff characteristics of the tributaries therefore determine the quantity of flow in the Ohio at any time.

The Corps of Engineers operates numerous reservoirs in the Ohio River Basin. Most were built for flood control purposes; many are also used to provide flow augmentation at critical periods. This has resulted in an increase in the quantity of flow which can be expected in the dry weather months.

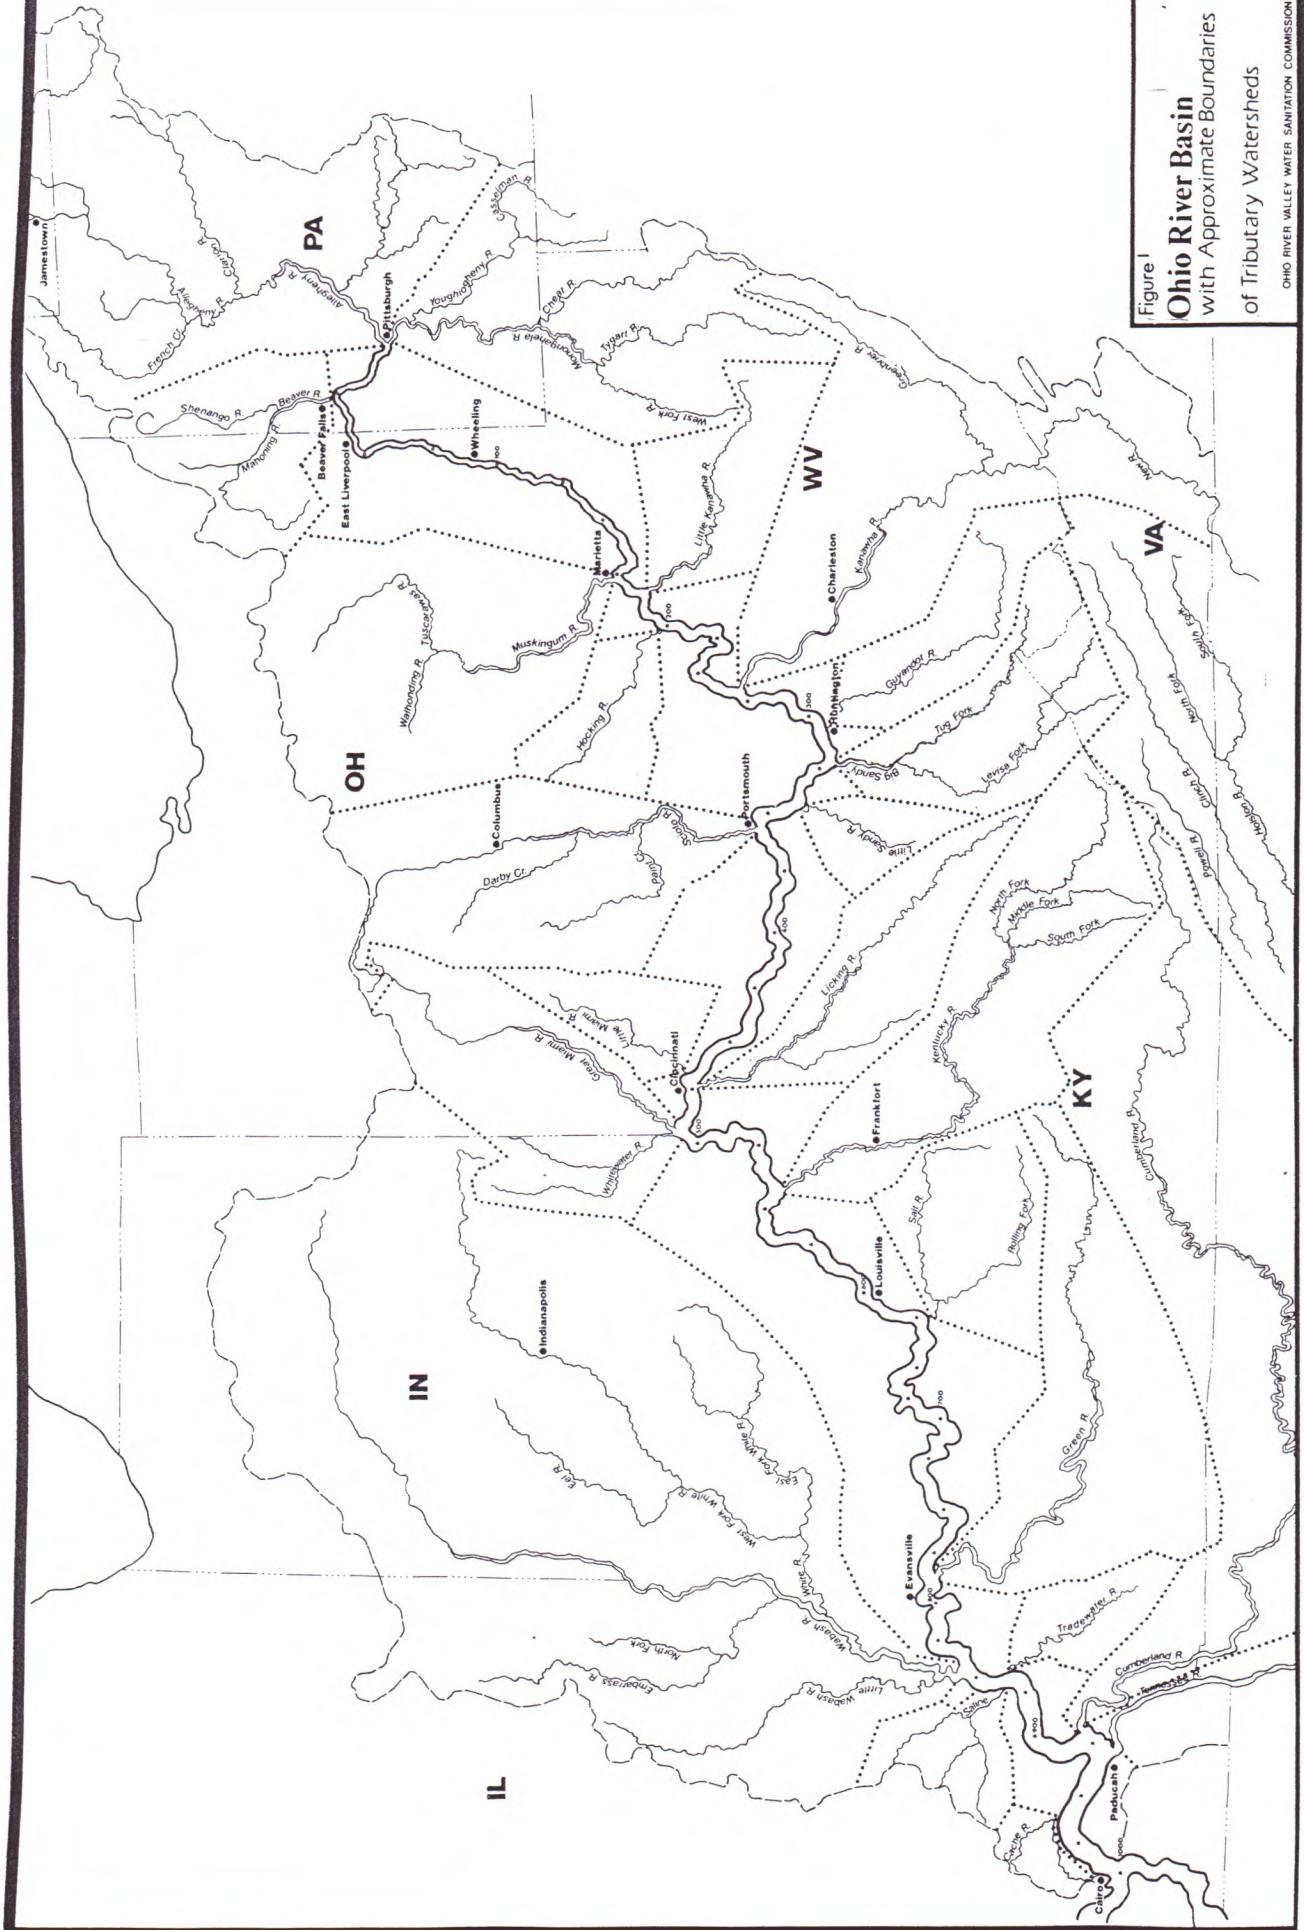

Climate is a major factor in determining the seasonal variation in stream flow. Precipitation is the most obvious factor. The form of precipitation--whether it is rain or snow--is also significant. Air temperature, besides determining the form of precipitation, is also the dominant factor determining water temperature. The amount of sunshine will affect the photosynthetic activity of aquatic organisms while wind speed can influence the surface turbulence of a large river which leads to atmospheric reaeration. Evaporation is a significant factor in the seasonal variation of stream flows. Inspection of the data presented shows that precipitation is lowest in February; due to the effects of evaporation, however, stream flow is lowest in September.

Because of the channelization of the Ohio River, it is possible to apply some basic hydraulic principles to estimate stream velocity and channel geometry. These principles cannot usually be applied to free flowing streams. A considerable amount of data on the cross-section of the river is available. Regression analysis has been applied to those data in order to obtain relationships for cross-sectional area, depth, and velocity at a base flow of 10,000 cubic feet per second. Under the assumption that the cross-sectional area does not vary greatly when the river is at pool stage, a direct relationship between flow and velocity can be inferred. This is the basis for time-of-travel estimates by the Commission which have proven fairly accurate in spill situations.

The lowest flow to be expected for seven consecutive days in a ten-year period has been established as the basis for water quality standards and associated treatment requirements for wastewater discharges. That flow on the Ohio River is determined to a large degree by the operations of the Corps of Engineers which are designed to maintain a minimum depth of nine feet for navigation purposes.

Derived from cross sectional area data provided by the U.S. Corps of Engineers.

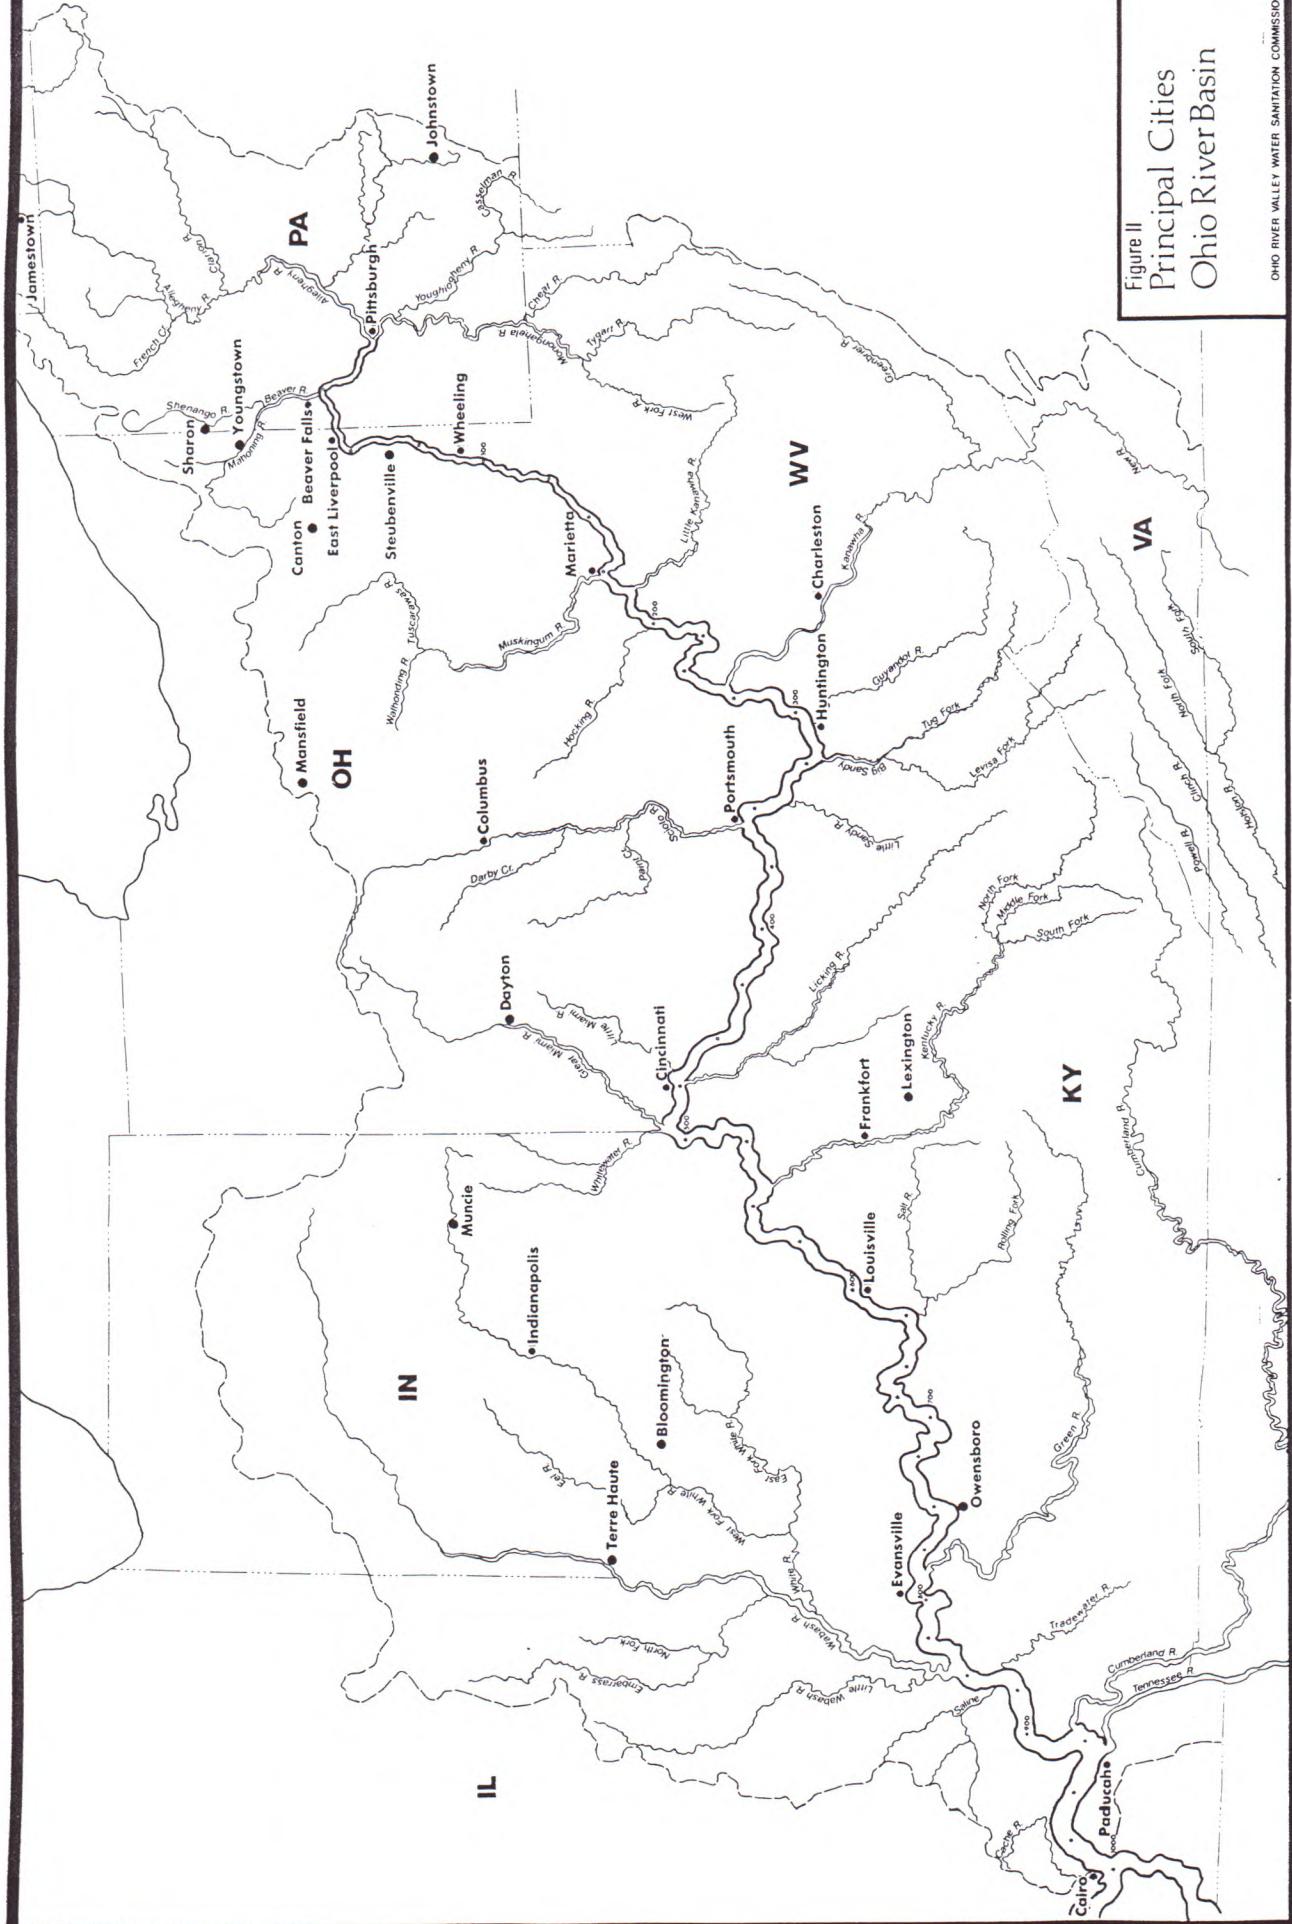

SECTION II: LAND USE

Land use is a significant factor in determining both the runoff characteristics of a drainage basin and the water quality of its streams. In urban areas with considerable paved surfaces and storm drainage systems, runoff is conveyed quickly to streams. Runoff is conveyed more slowly from forested areas. Runoff from cropland may contain nutrients from fertilizers as well as pesticides. Urban runoff can contain numerous constituents such as road salts and heavy metals.

Three summaries of land use are presented on the following pages. The first presents land use in the entire drainage areas, including tributaries, of certain Ohio River locations. The second summary is of land use in major tributary basins. The third summary is of land use in the drainage area of the Ohio River and minor tributaries arranged by segment. The 19 segments are those used by the Commission for analytical purposes.

The remainder of this section presents data on population within the basin. The number of people living in an area will determine the amount of domestic wastewater generated. The data indicate that the population residing in the basin continues to grow, and that most of the growth is occurring in outlying areas. The central cities generally show population declines.

Figure II
Principal Cities
Ohio River Basin

LAND USE IN DRAINAGE AREAS OF OHIO RIVER LOCATIONS

Location	Mile Point	Drainage Area (Square Miles)	Percent			
			Cropland	Pasture	Forest	Urban
South Heights	15.2	19,500	10.5	7.6	49.7	4.7

SECTION III: WATER USE

The Ohio River is used for numerous purposes including navigation, water supply, and recreation. Several uses are highly dependent on water quality--public and industrial water supply, fishing, and swimming. Others, such as navigation and industrial use, can affect water quality. The river is also used extensively for the assimilation of treated wastewaters. The degree of treatment affects the ability of the river to assimilate the effluents, which in turn affects its ability to support other uses.

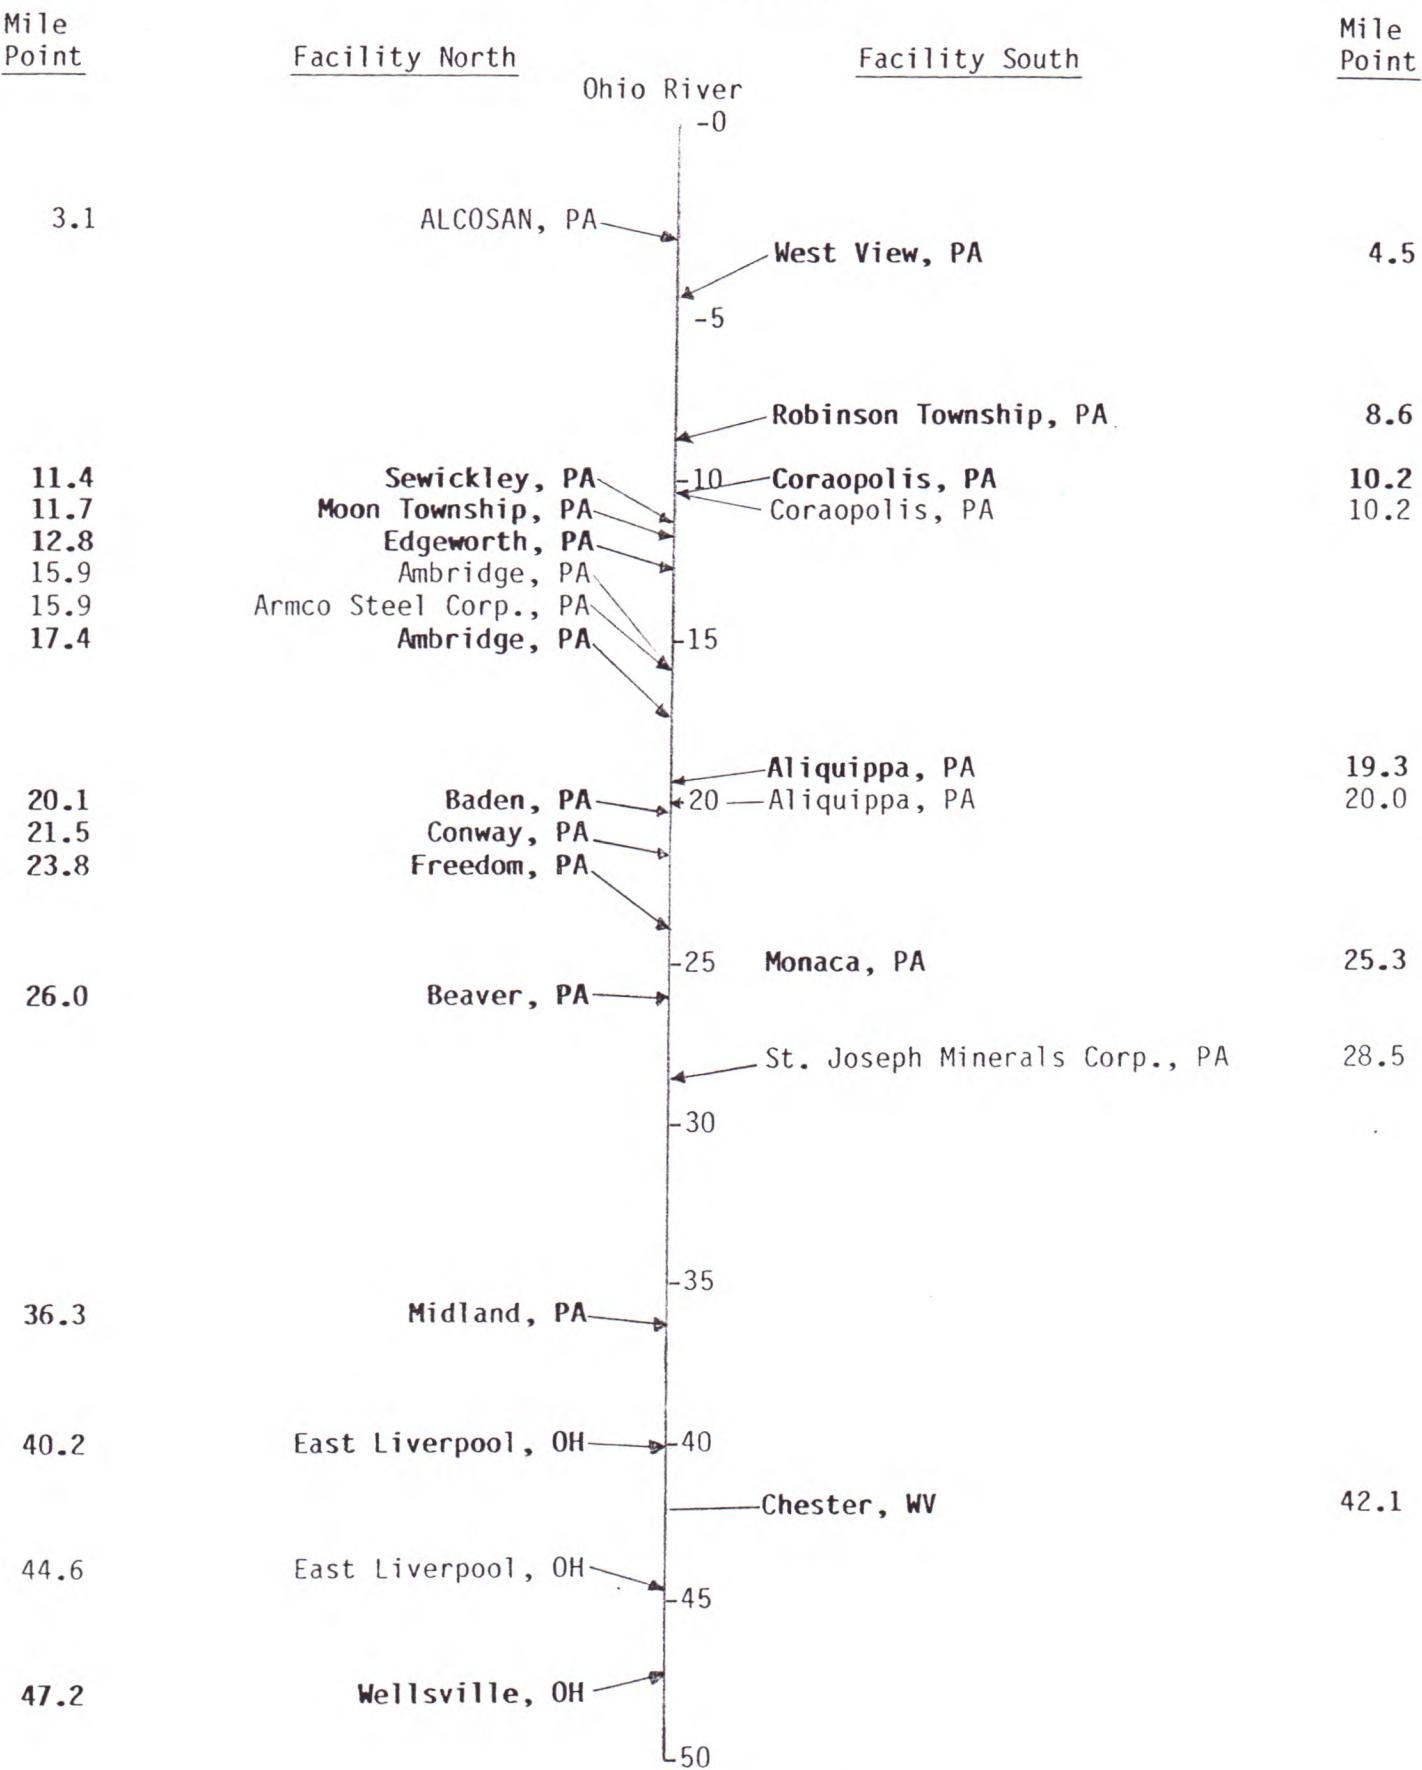

Recreational use takes place all along the river. There are no formal bathing beaches on the river. Water contact recreation on the Ohio consists primarily of water skiing and swimming from boats. In the summary of segments, the number of docks and launch ramps in each segment is presented to provide an indication of the extent of pleasure boating which takes place.

Location of water intakes for municipalities and industries can be more readily identified. The Ohio River serves as a source of drinking water for over three million people. A variety of industries use the river for cooling and process water.

Power generating facilities use large quantities of water for cooling purposes. Older facilities have once-through cooling in which the water used is returned to the river at an elevated temperature. In order to prevent thermal pollution, newer plants have off-stream cooling in which the water is recirculated through cooling towers. While these systems eliminate the thermal pollution potential, they consume more water.

The final list in this section is of river terminals which handle petroleum products and/or hazardous chemicals. These facilities are potential sites for spills to the river during the loading and unloading of cargoes.

Figure III

Municipal Water Intakes and Wastewater Discharges
of Two MGD or Greater

Legend:

Bold print indicates municipal intakes, all other facilities are municipal and industrial wastewater discharges; arrows indicate approximate stream location.

SECTION IV: WATER QUALITY

Water quality of the Ohio River and its tributaries is monitored routinely by the Commission, the states, and the U.S. Geological Survey. Data from all of these efforts are entered into STORET, the data storage and retrieval system of the U.S. Environmental Protection Agency.

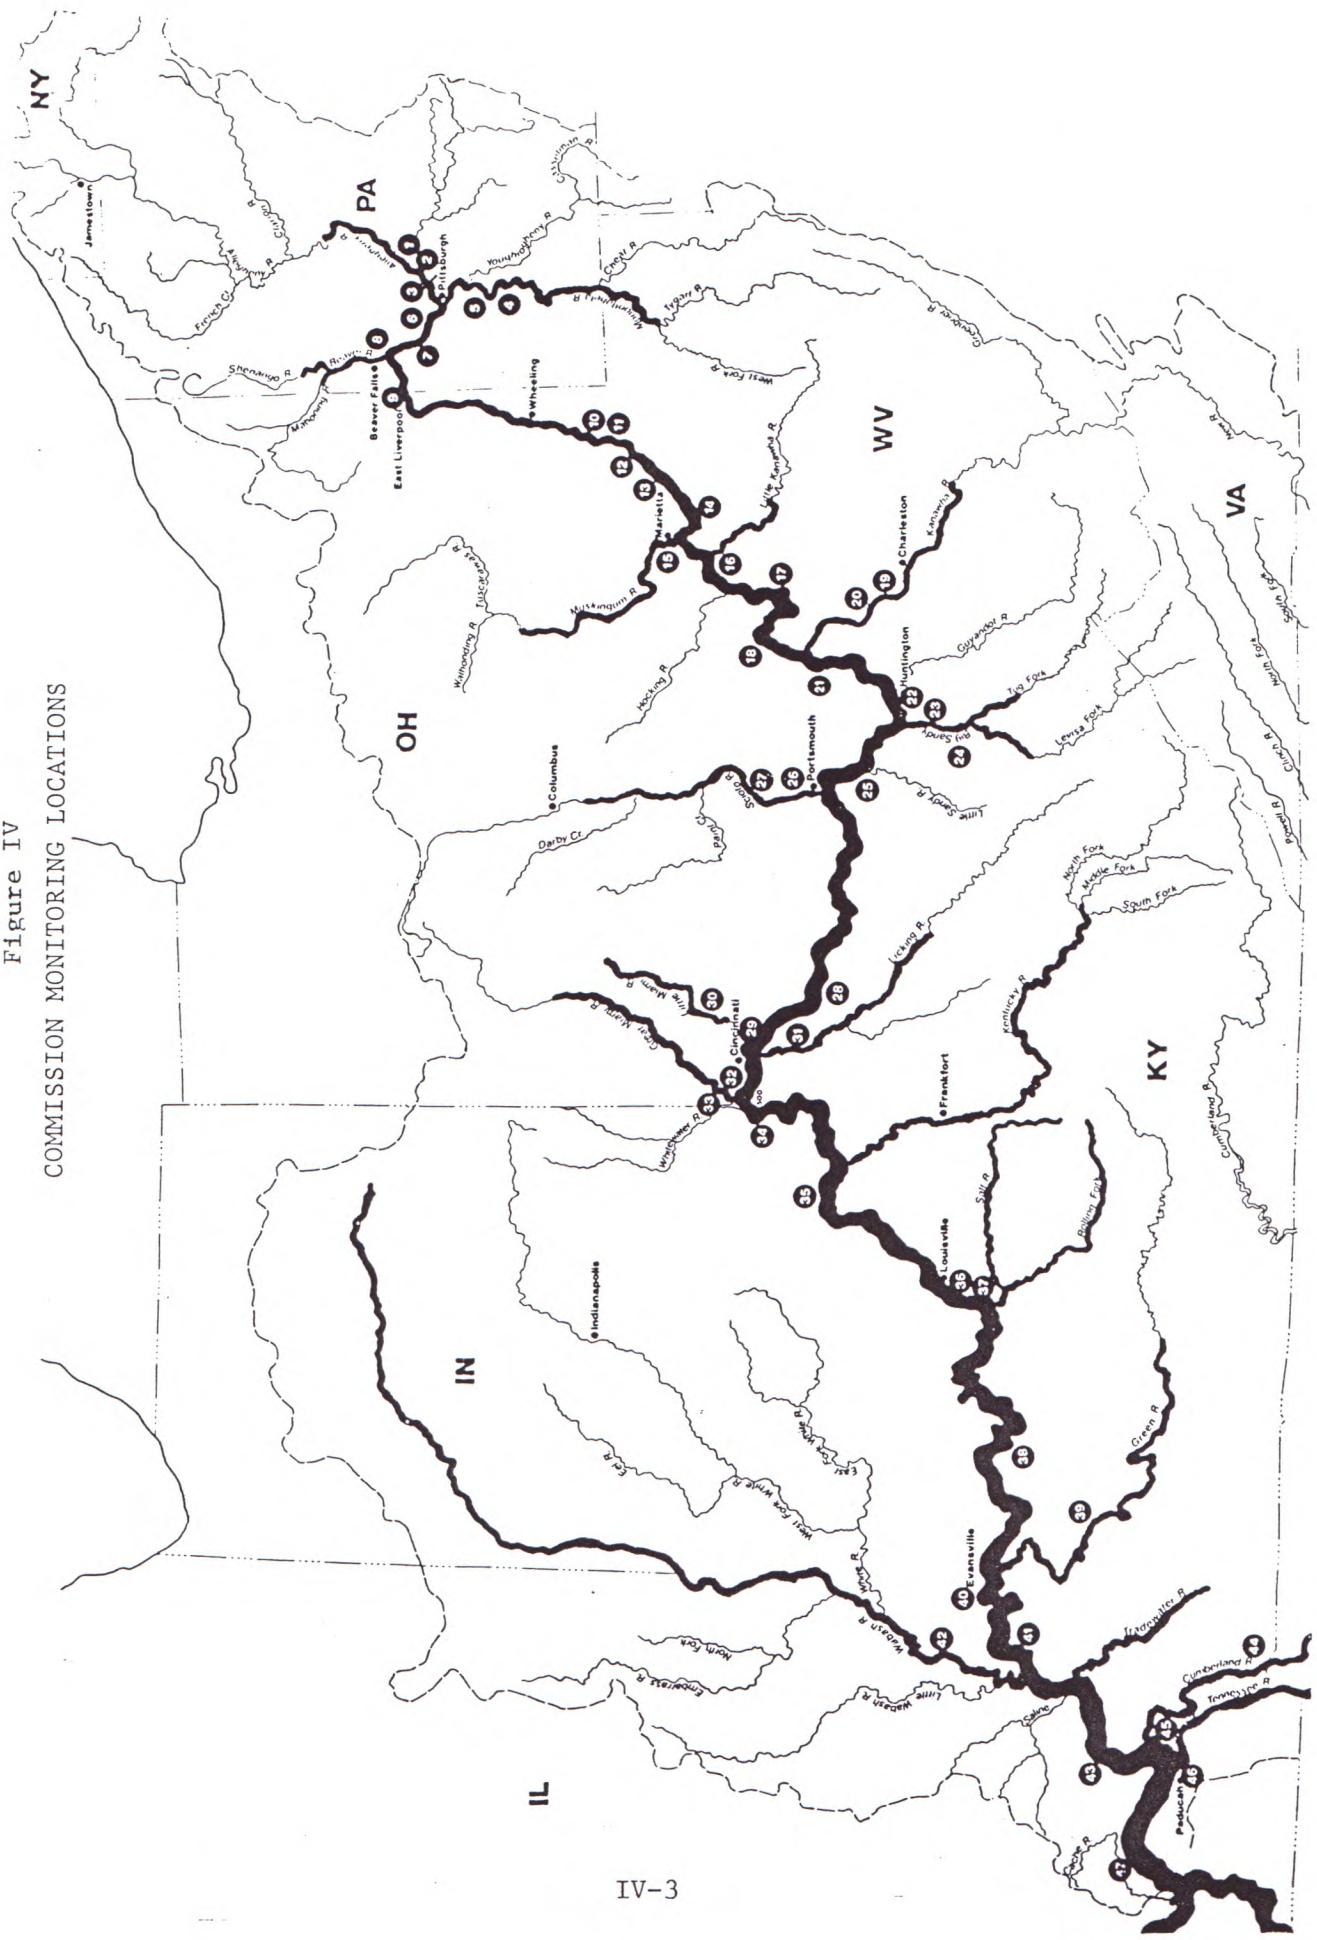

The Commission has the primary responsibility for monitoring the Ohio River main stem. Samples are also collected from major tributaries just above their confluence with the Ohio in order to assess their impacts. Four monitoring systems are maintained by the Commission: Water Users, Electronic, Manual, and Organics Detection System. The Water Users Network, which is the oldest of the systems, consists of data collected by water utilities along the river as part of their operations and sent to the Commission. The network was established in the 1950's, but some utilities have data extending back to the early 1900's. The electronic monitoring system consists of 22 monitors on the Ohio River and major tributaries which provide hourly measurements of temperature, specific conductance, pH, and dissolved oxygen. Data are conveyed to Commission headquarters by telemetry. The manual system involves collection of monthly samples at 38 sites. The samples are analyzed for 33 physical, chemical, and bacteriological parameters. The Organics Detection System consists of 13 water utilities which run daily analyses of river samples by gas chromatograph for 17 purgable halogenated organic compounds.

Each of the states operates a sampling network similar to the Commission's manual sampling program. The states' efforts in the Ohio River Basin are concentrated on the tributaries. The combined results of the state and Commission networks presents a comprehensive picture of Ohio River water quality.

The U.S. Geological Survey operates the National Stream Quality Accounting Network, or NASQAN. This network involves monthly sampling at sites throughout the United States. A total of 25 NASQAN sites are located in the Ohio River Basin.

Historic data for flow, temperature, and specific conductance are presented for electronic monitor locations. The data are for the period of record for each monitor through 1984. Only those monitors which are currently operating and for which eight or more years of data are available are presented. The behavior of these parameters describes seasonal patterns at each monitoring site which are major influences on overall water quality conditions.

APPENDIX A

CONVERSION FACTORS FOR WATER QUALITY ANALYSIS

FLOW

1 Million Gallons per Day (MGD)	= 1.545 cfs	= 694.4 GPM	= 43.8 LPS
1 Cubic Foot per Second (cfs)	= .646 MGD	= 448.6 GPM	= 28.3 LPS
1 Gallon per Minute (GPM)	= .00144 MGD	= .000093 cfs	= .063 LPS
1 Liter per Second (LPS)	= .023 MGD	= .036 cfs	= 15.9 GPM

VELOCITY

1 Foot per Second (fps)	= .682 MPH	= .303 mps	= 1.09 KPH
1 Mile per Hour (MPH)	= 1.47 fps	= .444 mps	= 1.61 KPH
1 Meter per Second (mps)	= 3.3 fps	= 2.25 MPH	= 3.6 MPH
1 Kilometer per Hour (KPH)	= .92 fps	= .62 MPH	= .28 mps

MASS DISCHARGE

$$\begin{aligned} \text{Discharge in Pounds per day} &= \text{Flow (MGD)} \times \text{Concentration (mg/l)} \times 8.33 \\ &= \text{Flow (cfs)} \times \text{Concentration (mg/l)} \times 5.39 \\ &= \text{Flow (GPM)} \times \text{Concentration (mg/l)} \times .012 \\ &= \text{Flow (LPS)} \times \text{Concentration (mg/l)} \times .192 \end{aligned}$$

$$\begin{aligned} \text{Discharge in Kilograms per day} &= \text{Flow (MGD)} \times \text{Concentration (mg/l)} \times 3.78 \\ &= \text{Flow (cfs)} \times \text{Concentration (mg/l)} \times 2.44 \\ &= \text{Flow (GPM)} \times \text{Concentration (mg/l)} \times .0054 \\ &= \text{Flow (LPS)} \times \text{Concentration (mg/l)} \times .0864 \end{aligned}$$

$$\begin{aligned} 1 \text{ pound per day} &= .454 \text{ kilograms per day} \\ 1 \text{ kilogram per day} &= 2.2 \text{ pounds per day} \end{aligned}$$

Calculation of stream concentration resulting from a spill or shock load

$$\text{Load (L) in pounds: } \text{Concentration (C)} = \frac{L \times T}{5.39 Q}$$

Q = Stream flow in cfs

$$L \text{ in kilograms: } C = \frac{L \times T}{2.44 Q}$$

T = Duration of spill or shock load expressed as fraction of a day
t = duration of spill

$$\text{If } t \text{ is expressed in days, } T = \frac{1}{t}$$

$$\text{If } t \text{ is expressed in hours, } T = \frac{24}{t}$$

$$\text{If } t \text{ is expressed in minutes, } T = \frac{1440}{t}$$

$$\text{If } t \text{ is expressed in seconds, } T = \frac{86,400}{t}$$

OHIO RIVER VALLEY WATER SANITATION COMMISSION

POLLUTION CONTROL STANDARDS

(September 13, 1984 Revision)

NOTICE OF REQUIREMENTS

**ESTABLISHED BY POLLUTION CONTROL STANDARDS
FOR DISCHARGES TO THE OHIO RIVER**
September 13, 1984 Revision

You are hereby notified that, having considered all the evidence presented at public hearings, the Ohio River Valley Water Sanitation Commission, at its regularly held meeting on September 13, 1984, acting in accordance with and pursuant to the authority contained in Article VI of the Ohio River Valley Water Sanitation Compact, adopted and promulgated, subject to revision as changing conditions require, Pollution Control Standards (September 13, 1984 Revision) for the modification or treatment of all sewage from municipalities or other political subdivisions, public or private institutions, corporations, or watercraft, and for the modification or treatment of all industrial wastes discharged or permitted to flow into the Ohio River from the point of confluence of the Allegheny and Monongahela Rivers at Pittsburgh, Pennsylvania, designated as Ohio River mile point 0.0, to Cairo Point, Illinois, located at the confluence of the Ohio and Mississippi Rivers, and being 981.0 miles downstream from Pittsburgh, Pennsylvania.

Under terms and provisions of the Ohio River Valley Water Sanitation Compact all sewage from municipalities or other political subdivisions, public or private institutions, corporations or watercraft and all industrial wastes discharged or permitted to flow into the Ohio River will be required to be modified or treated to the extent specified in the standards established as above set forth.

The Commission at its September 13, 1984 meeting also rescinded both Pollution Control Standard No. 1-70 and Pollution Control Standard No. 2-70, which were established by Commission action November 13, 1970, including all definitions and application procedures appended to or incorporated therein, together with such other treatment standards and regulatory actions as have been heretofore adopted.

Leo Weaver
Executive Director and Chief Engineer

The Ohio River Valley Water Sanitation Commission

An interstate Commission created by compact among: Illinois • Indiana • Kentucky • New York •
Ohio • Pennsylvania • Virginia • West Virginia •
Headquarters: 414 Walnut Street, Cincinnati, Ohio 45202

I.

PREAMBLE^a

Pollution control standards implement many decisions affecting water quality of the Ohio River and the uses made thereof. The Ohio River Valley Water Sanitation Compact provides the basis for assuring multipurpose uses of the Ohio River, and authorizes the Commission to promulgate standards of treatment for sewage or industrial wastes. It also states that: "The guiding principle of this Compact shall be that pollution by sewage or industrial wastes originating within a signatory state shall not injuriously affect the various uses of the interstate waters as hereinbefore defined."

The purpose of these regulations, therefore, is to recognize those uses to be protected in the Ohio River, establish stream criteria to assure that the uses will be achieved, and set Standards of Treatment needed to attain the established stream criteria and parameter levels. These regulations also implement the formal decisions of the Commission as they are concerned with pollution control activities, the granting of variances upon justification and recognize that individual states may adopt more stringent regulations.

Article IX of the Compact grants the Commission certain enforcement powers. These regulations must be implemented in the issuance of any permit to a discharger to the mainstem of the Ohio River (unless the state or the Federal government has a more stringent regulation).

II.

DEFINITIONS

- A. "*Cooling Water*" means non-contact cooling water used as a heat transfer medium for once-through cooling or cooling tower blowdown to which no Industrial Wastes, Toxic Wastes, Residues from Potable Water Treatment Plants, untreated Sewage, or Other Wastes, exclusive of approved anti-fouling agents (e.g., chlorine) are added prior to discharge.
- *B. "*Compact*," as used in these regulations, means the Ohio River Valley Water Sanitation Compact and is an agreement entered into by and between the states of Indiana, West Virginia, Ohio, New York, Illinois,

^a Specific Standards of Treatment are established in these regulations and must be incorporated into discharge permits upon issuance or reissuance when they are more stringent than:

- 1. applicable US EPA technology-based effluent guidelines required under Section 301 of the Federal Clean Water Act, or
- 2. any state treatment requirements, effluent standards, or water quality based effluent limitations.

In the absence of promulgated Federal effluent guidelines pursuant to Section 301 of the Clean Water Act, the Compact signatory states have the responsibility to establish effluent limitations to be included in any discharge permit, consistent with the standards contained herein using Best Professional Judgment on a case by case basis.

Kentucky, Pennsylvania, and Virginia, which pledges each to the other of the signatory states faithful cooperation in the control of future pollution and abatement of existing pollution from the waters in the Ohio River basin. This compact created the Ohio River Valley Water Sanitation Commission (ORSANCO).

- *C. "*Industrial Wastes*" means any liquid, gaseous, solid materials or waste substances or combination thereof other than Cooling Water as herein defined, resulting from any process or operation including storage and transportation, manufacturing, commercial, agricultural, and government operations.
- D. "*Mixing Zone*" means that portion of the water body receiving a discharge where effluent and receiving waters are not totally mixed and uniform with the result that the zone is not representative of the receiving waters and may not meet all ambient water quality standards or other requirements of any signatory state applicable to the particular receiving waters.
- E. "*Net Discharge*" is determined by excluding the amount of pollutant in an influent when determining the quality of an effluent if both the intake and discharge are from and to the same body of water.
- F. "*96 hour LC₅₀*" as used in these standards means the concentration that kills 50 percent of the test organisms within 96 hours. The test organisms shall be Representative Important Species indigenous to the Ohio River.
- G. "*Non-Cumulative Substances*" means compounds which have a biological half-life of less than four days. All other compounds are cumulative substances.
- *H. The "*Ohio River*," as used in these regulations, extends from the point of confluence of the Allegheny and Monongahela Rivers at Pittsburgh, Pennsylvania, designated as Ohio River mile-point 0.0 to Cairo Point, Illinois, located at the confluence of the Ohio and Mississippi Rivers and being 981.0 miles downstream from Pittsburgh.
- *I. "*Ohio River Valley Water Sanitation Commission*" (Commission) means a body corporate created by authority of the Compact and is the operating agency established to implement the Compact. It consists of three (3) representatives of each signatory state and three (3) representatives of the Federal government.

*Terms contained in the Ohio River Valley Water Sanitation Compact

- J. “*Other Wastes*” means any waste other than Sewage, Cooling Water, Residues from Potable Water Treatment Plants, Industrial Wastes or Toxic Wastes, which if discharged to the Ohio River could cause or contribute to any violations of these regulations, or of any water quality standards of any signatory state or which may be deleterious to the designated uses of those waters.
- K. “*Primary Contact Recreation*” means recreational activities where the human body may come in direct contact with water to the point of complete body submergence and where ingestion of the water is probable.
- L. “*Representative Important Species*” means those species of aquatic life whose protection and propagation will assure the sustained presence of a balanced indigenous community. Such species are representative in the sense that maintenance of suitable water quality conditions will assure the overall protection and sustained propagation of the balanced indigenous community.
- M. “*Residues from Potable Water Treatment Plants*” means those wastes emanating from processes used in water purification. Such processes may include sedimentation, chemical coagulation, filtration, iron and manganese removal, softening and disinfection.
- *N. “*Sewage*” means water-carried human or animal wastes from such sources as residences; industrial, commercial or governmental establishments; public or private institutions; or other places. The admixture of Sewage with Industrial Wastes, Toxic Wastes or Other Wastes, in amounts detrimental to the quality of the combined effluent shall also be regarded as Sewage.
- *O. “*Standards of Treatment*” means the degree of processing of wastes necessary to meet the specific discharge limitations provided by these regulations but does not prescribe the methodology.
- *P. “*Substantially Complete Removal*” means removal to the lowest practicable level attainable with current technology.
- Q. “*Toxic Wastes*” means wastes containing substances or combinations of substances which might reasonably be expected to cause death, disease, behavioral abnormalities, cancer, genetic mutations, physiological malfunctions, including malfunctions in reproduction, or physical deformations in fish, other aquatic life, wildlife, livestock, or humans.

*Terms contained in the Ohio River Valley Water Sanitation Compact

III.

DESIGNATED USES

The Ohio River, as hereinbefore defined, has been designated by the Compact for safe and satisfactory use as public and industrial water supplies after reasonable treatment, suitable for recreational usage, capable of maintaining fish and other aquatic life and adaptable to such other uses as may be legitimate.

IV.

STREAM CRITERIA

- A. The stream criteria which these regulations are intended to achieve in the receiving waters outside the Mixing Zone are as follows:
 1. Freedom from anything that will settle to form putrescent or otherwise objectionable sludge deposits which interfere with designated water uses;
 2. Freedom from floating debris, scum, oil (in whatever state, i.e., free, emulsified, dispersed and dissolved), and other floating material in amount sufficient to be unsightly or deleterious;
 3. Freedom from materials producing color or odors in such a degree as to create unaesthetic conditions or a nuisance;
 4. Freedom from substances in concentrations which are toxic or harmful to humans, animals, or fish and other aquatic life; which would in any manner adversely affect the flavor, color, odor, or edibility of fish and other aquatic life, wildlife or livestock; or which are otherwise detrimental to the designated uses specified in Section III.
- B. These criteria relate to the conditions of waters as affected by the direct and indirect discharges of Sewage, Industrial Wastes, Toxic Wastes, Other Wastes, Cooling Water or Residues from Potable Water Treatment Plants. They also include consideration of permanent alterations of the water body such as channeling, diversions, or impoundment. The natural waters of the Ohio River may have characteristics which do not meet the stream criteria and parameter levels set forth below.
- C. To assure that the foregoing criteria will be attained, the following parameter levels shall be met outside the Mixing Zone:
 1. DISSOLVED OXYGEN: Concentrations shall average at least 5.0 mg/l per calendar day and shall not be less than 4.0 mg/l at any time provided that a minimum of 5.0 mg/l at any time is maintained during the April 15-June 15 spawning season.

2. TEMPERATURE: Allowable stream temperatures are:

<u>MONTH/DATE</u>	<u>PERIOD</u>	<u>INSTANTANEOUS MAXIMUM (°F)</u>
	<u>AVERAGE (°F)</u>	
January 1-31	45	50
February 1-29	45	50
March 1-15	51	56
March 16-31	54	59
April 1-15	58	64
April 16-30	64	69
May 1-15	68	73
May 16-31	75	80
June 1-15	80	85
June 16-30	83	87
July 1-31	84	89
August 1-31	84	89
September 1-15	84	87
September 16-30	82	86
October 1-15	77	82
October 16-31	72	77
November 1-30	67	72
December 1-31	52	57

3. pH: No value below 6.0 nor above 9.0.

4. TOXIC SUBSTANCES:

- a. Non-Cumulative Substances — not to exceed one-tenth (0.1) of the 96 hour LC₅₀ of Representative Important Species indigenous to the Ohio River.
- b. Cumulative Substances — not to exceed one one-hundredth (0.01) of the 96 hour LC₅₀ of Representative Important Species indigenous to the Ohio River.
- c. Other limiting concentrations may be used when justified on the basis of available evidence and approved by the appropriate regulatory agency or agencies.

5. BACTERIA

Maximum allowable level of fecal coliform for Primary Contact Recreation — Content (either MPN or MF count) shall not exceed 200/100 ml as a monthly geometric mean based on not less than five samples per month; nor exceed 400/100 ml in more than ten percent of all samples taken during the month; these limits are applicable to waters designated for recreational use during the recreation season (May through October).

Maximum allowable level of fecal coliform for other uses — Fecal coliform content (either MPN or MF count) shall not exceed 2,000/100 ml as a monthly geometric mean based on not less than five samples per month.

6. DISSOLVED SOLIDS: Not to exceed 500 mg/l as a monthly average value, nor exceed 750 mg/l at any time. (Equivalent 25 deg. C specific conductance values are 800 and 1,200 micromhos/cm.)
7. AMMONIA: The concentration of un-ionized ammonia (as NH₃) shall not exceed 0.05 mg/l; un-ionized ammonia shall be determined from values shown in Appendix B for total ammonia-N, pH and temperature and the following equation:

$$Y = \frac{1.2 \text{ (Total ammonia-N)}}{[1 + 10(pK_a - pH)]}$$

$$pK_a = 0.0902 + \frac{2730}{(273.2 + T)}$$

T = Temperature degree C.

Y = Un-ionized ammonia

8. CHEMICAL CONSTITUENTS: Not to exceed the concentrations in the following table at any time (dissolved limits, where applicable, are identified):

CONSTITUENTS	CONCENTRATION (mg/l)
Arsenic	0.05
Barium	1.0
Cadmium	0.01
Chloride	250
Chromium (hexavalent)	0.05
Cyanide	0.025
Fluoride	1.0
Lead (dissolved)	0.05
Mercury	0.0002
Nitrite-N + Nitrate-N	10
Nitrite-N	1.0
Phenol (phenolic materials)	0.01
Selenium	0.01
Silver	0.05
Sulfate	250

Copper:

TOTAL HARDNESS AS CALCIUM CARBONATE (mg/l)	CONCENTRATION (mg/l)
50	0.012
80	0.018
100	0.022
160	0.034
200	0.043

Zinc:

TOTAL HARDNESS AS CALCIUM CARBONATE (mg/l)	CONCENTRATION (mg/l)
0-80	0.040
81-120	0.055
121-160	0.070
161-180	0.095
181-200	0.115

9. RADIONUCLIDES: Gross total alpha activity (including radium-226 but excluding radon and uranium) shall not exceed 15 picocurie per liter (pCi/l) and combined radium-226 and radium-228 shall not exceed 5 pCi/l; provided that specific determinations of radium-226 and radium-228 are not required if gross particle activity does not exceed 5 pCi/l. Concentration of total gross beta particle activity shall not exceed 50 pCi/l; the concentration of tritium shall not exceed 20,000 pCi/l; the concentration of total strontium-90 shall not exceed 8 pCi/l.

V. STANDARDS OF TREATMENT

A. General

1. No discharge of any Sewage, Industrial Wastes, Toxic Wastes, Other Wastes, Cooling Water or Residues from Potable Water Treatment Plants shall cause or contribute to a violation of these regulations, shall preclude the attainment of any designated use of the mainstem waters of the Ohio River or shall interfere with the attainment of the stream criteria and parameter levels set forth in Section IV.
2. All discharge of Sewage, Industrial Wastes, Toxic Wastes, Other Wastes, Cooling Water or Residues from Potable Water Treatment Plants shall be treated or otherwise modified so as to provide:
 - a. Substantially Complete Removal of settleable solids, which may form sludge deposits;
 - b. Substantially Complete Removal of oil (in whatever state, including free, emulsified, dispersed and dissolved), debris, scum, and other floating material;
 - c. Reduction of total suspended solids and other materials to such a degree that the discharge will not produce a substantial negative visible contrast to natural conditions in turbidity, color or odor of the river, or impart taste to the potable water supplies or cause tainting of fish flesh;

- d. Reduction of all substances in amounts which, when concentrated or combined in the receiving stream, would result in conditions toxic or harmful to humans, animals, or fish and other aquatic life; which would in any manner adversely affect the flavor, color, odor, or edibility of fish and other aquatic life, wildlife or livestock; or which are otherwise detrimental to the designated water uses specified in Section III.

B. Sewage

1. MINIMUM LEVEL OF TREATMENT

The minimum level of treatment required for sewage prior to discharge shall meet the following standards in addition to those contained in Section V.A.

- a. Biochemical Oxygen Demand (five day)
 - i. The arithmetic mean of the values for effluent samples collected in a period of 30 consecutive days shall not exceed 30 milligrams per liter.
 - ii. The arithmetic mean of the values for effluent samples collected in a period of 7 consecutive days shall not exceed 45 milligrams per liter.
- b. Suspended Solids
 - i. The arithmetic mean of the values for effluent samples collected in a period of 30 consecutive days shall not exceed 30 milligrams per liter.
 - ii. The arithmetic mean of the values for effluent samples collected in a period of 7 consecutive days shall not exceed 45 milligrams per liter.
- c. pH

The effluent values for pH shall be maintained within the limits of 6.0 to 9.0.

d. Bacteria

Reduction of fecal coliform bacteria to such degree that (1) during the months of May through October fecal coliform density in the discharge does not exceed 200/100 ml as a monthly geometric mean (based on not less than ten samples per month), nor exceed 400/100 ml in more than ten percent of the samples examined during a month, and (2) during the months of November through April the den-

sity does not exceed 1,000/100 ml as a monthly geometric mean (based on not less than ten samples per month), nor exceed 2,000/100 ml in more than ten percent of the samples examined during a month.

2. ALTERNATIVE TREATMENT

Notwithstanding the requirements of Section V.B.1(a), (b), and (c), such facilities as oxidation ponds, lagoons and ditches, and trickling filters shall be deemed to provide effective treatment provided that the effluent does not cause a violation of the states' applicable water quality standards, or these regulations.

C. Industrial Wastes, Toxic Wastes and Other Wastes

1. The treatment of Industrial Wastes, Toxic Wastes, and Other Wastes prior to discharge shall be in accordance with Section V.A.
2. In addition, a Net Discharge of the following toxic pollutants is hereby prohibited:
 - a. Aldrin (1, 2, 3, 4, 10, 10-hexachloro-1, 4, 4a, 5, 8, 8a-hexahydro-1, 4-endo-5, 8-exo-dimethanonaphthalene)
 - b. Dieldrin (1, 2, 3, 4, 10, 10-hexachloro-6, 7-epoxy-1, 4, 4a, 5, 6, 7, 8, 8a-octahydro-1, 4-endo-5, 8-exo-dimethanonaphthalene)
 - c. DDT, including DDD and DDE
 1. DDT means 1, 1, 1-trichloro-2, 2-bis (p-chlorophenyl) ethane and some o, p'-isomers
 2. DDD (TDE) means 1, 1-dichloro-2, 2-bis (p-chlorophenyl) ethane and some o, p'-isomers
 3. DDE means 1, 1-dichloro-2, 2-bis (p-chlorophenyl) ethylene
 - d. Endrin (1, 2, 3, 4, 10, 10-hexachloro-6, 7-epoxy-1, 4, 4a, 5, 6, 7, 8, 8a-octahydro-1, 4-endo-5, 8-endo-dimethanonaphthalene)
 - e. Toxaphene - a material consisting of technical grade chlorinated camphene having the approximate formula of C₁₀H₁₀Cl₈ and normally containing 67-69 percent chlorine by weight

- f. Benzidine - the compound benzidine and its salts as identified by the chemical name 4, 4-diaminobiphenyl
- g. Polychlorinated Biphenyls (PCB) - a mixture of compounds composed of the biphenyl molecule which has been chlorinated to varying degrees

D. **Residues from Potable Water Treatment Plants**

The use of controlled discharge for Residues from Potable Water Treatment Plant processes of sedimentation, coagulation and filtration may be authorized provided that as a minimum the discharge meets all the requirements of Section IV. A. and V.A.

VI. MIXING ZONE DESIGNATION

- A. A Mixing Zone shall be deemed to exist for each discharge. When required, the specific numerical limits for any Mixing Zone shall be determined on a case by case basis, and shall include considerations for existing uses, linear distance (i.e., length and width) from the point of discharge, surface area involved, and volume of receiving water within the defined zone.
- B. Conditions within the Mixing Zone shall not be injurious to human health, in the event of a temporary exposure.
- C. Conditions within the Mixing Zone shall not be lethal to aquatic life or wildlife that may enter the zone.
- D. The Mixing Zone shall be free from substances attributable to Sewage, Industrial Wastes, Toxic Wastes, Other Wastes, Cooling Water, or Residues from Potable Water Treatment Plants in quantities which:
 1. Settle to form sludge deposits;
 2. Float as debris, scum, or oil;
 3. Contaminate natural sediments so as to cause or contribute to a violation of:
 - a. appropriate stream criteria and parameter levels outside the Mixing Zone, or
 - b. any condition of the designated uses of the water;
 4. Impart a disagreeable flavor or odor to flesh of fish or other aquatic life, wildlife or livestock which are consumed by man and which ac-

quire such a flavor because of passage through or ingestion of the waters from the Mixing Zone.

- E. The Mixing Zone shall be located so as not to interfere significantly with migratory movements and passage of fish, other aquatic life and wildlife. No waste discharge related to the Mixing Zone shall, outside the limits of the Mixing Zone, interfere with potable water supply intakes, bathing areas, reproduction of fish, other aquatic life and wildlife; or adversely affect fish or aquatic life normally inhabiting waters prior to addition of waste discharged; or result in any other violations of appropriate stream criteria and parameter levels relating to the designated use at or above critical river flow as shown in Appendix A.

VII. ADDITIONAL TREATMENT

In order to protect the public health or the uses specified in Section III, such higher degrees of treatment or reduction in waste loads may be determined to be necessary by the Commission after investigation, due notice and hearing.

VIII. LIMITATION

Nothing contained in these regulations shall be construed to limit the powers of any state signatory to the Compact to promulgate more stringent criteria, conditions and restrictions to further lessen or prevent the pollution of waters within its jurisdiction.

IX. VARIANCE

- A. The Commission may grant a variance from the provisions in Section V of these regulations, in accordance with the following procedures, provided that the uses set forth in Section III are maintained:
1. The burden of proof is upon the applicant to assure that the uses set forth in Section III are maintained;
 2. Prior concurrence of the state where the applicant's discharge is located and those state(s) which may be affected must be obtained;
 3. The specific reasons for the variance shall be clearly stated in writing;
 4. Such additional information shall be provided to the Commission as it may request.
- B. A variance may be granted for a period not to exceed the life of the applicable discharge permit; the applicant may apply for a variance renewal prior to the expiration of the permit.

X.

ANALYTICAL METHODS

Tests or analytical determinations to determine compliance or non-compliance with the Standards of Treatment, stream criteria and parameter levels established hereby shall be made in accordance with accepted procedures such as those contained in the most recent edition of (a) *Standard Methods for the Examination of Water and Wastewater* prepared and published jointly by the American Public Health Association (APHA), American Water Works Association (AWWA), and Water Pollution Control Federation; (b) *Annual Book of ASTM Standards Part 31 — Water* published by the American Society for Testing and Materials; (c) 40 CFR 136 — *Guidelines Establishing Test Procedures for the Analysis of Pollutants* by the U.S. Environmental Protection Agency; or (d) by such other methods as are approved by the Commission equal to or superior to or not available within methods in documents listed above, provided such other test methods are available to the public.

XI.

SEVERABILITY CLAUSE

Should any one or more of the Pollution Control Standards hereby established or should any one or more provision of the regulations herein contained be held or determined to be invalid, illegal or unenforceable, for any reason whatsoever, all other Standards and other provisions shall remain effective and shall be construed, applied and enforced as if the invalid, illegal or unenforceable language had not been included.

APPENDIX A CRITICAL FLOW VALUES

River Reach		
From	To	Critical Flow in cfs*
Pittsburgh	Montgomery Dam (MP 32.4)	4,800
Montgomery	Willow Island Dam (MP 161.8)	5,800
