Date: Thursday, July 26, 2018 9:44:42 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Laura Colston

Subject: Protect the Ohio River, Too!
Date: Thursday, July 26, 2018 10:25:25 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Chelsea Kramek

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Elizabeth Davis

Subject: Protect the Ohio River, Too!
Date: Friday, July 27, 2018 6:03:15 AM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Peter Lyman

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Three weeks ago, Pipe Creek, which runs into the Ohio River just below Shadyside, Ohio has become contaminated with sulfur from coal mines. This stream has never had this problem. We used to use that water for the gardens, minnows for fishing bait and plenty of water birds in the spring. Now that water is not good for anything.

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Virginia Horn

Subject: Protect the Ohio River, Too!
Date: Friday, July 27, 2018 9:26:08 AM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Stephanie Lesicko

This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Cassie Patterson

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Lori Runyon

Subject: Protect the Ohio River, Too!
Date: Friday, July 27, 2018 11:55:00 AM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Linda Andrews

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

From: [Niles Rosenquist](#)
To: PCS@orsanco.org
Subject: ORSANCO water quality standards
Date: Friday, July 27, 2018 3:08:06 PM

I am writing to express my opposition to the proposed elimination of ORSANCO's water quality standards.

It is simply not true that these rules are unnecessary due to the rules enacted by the individual states:

Some of ORSANCO's standards are more stringent than the state's

ORSANCO covers 122 pollutants, not all of which are covered by some states

ORSANCO does not allow mixing zones for some specific pollutants that are allowed by some states.

ORSANCO provides an important level of consistency to the standards which is valuable both to the environment and to the regulated community.

Most importantly the Ohio River remains a very polluted river and this is not the time to eliminate this long-standing and very important level of protection for the river.

Subject: Public Comment on ORSANCO Ohio River Pollution Control Standards 2018 revision
Date: Friday, July 27, 2018 3:50:20 PM

I am writing to express my dismay at the ORSANCO pollution control standards revision being proposed. The water in the Ohio River has been polluted for decades, and the standards of the agreement under ORSANCO was one step toward reversing this trend and making this vital water source a clean one. Please consider how these revisions will negatively impact the cleanliness of the Ohio River and affect all of the states it runs through. I support environmental monitoring for the sake of the ecosystems which have at their center the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Laura Taylor

Date: Saturday, July 28, 2018 5:37:16 AM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Caxixi Holsworth

Subject: Protect the Ohio River, Too!
Date: Saturday, July 28, 2018 11:06:31 AM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Kristen Grout

Subject: Pollution standard proposal
Date: Saturday, July 28, 2018 4:43:35 PM

July 28,2018

To whom it may concern,

I do not agree with ANY proposal that will lessen or eliminate current oversight, standards, or restrictions that protect our waterways. Human greed and self interest always need to be controlled by laws and legislation for the welfare of our citizens. Hinkley, California; Flint,Michigan; and most recently State of Texas are proof of this statement. We need to keep our water safe for human use and consumption!

Sincerely,
Gail Mitchell

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Ashley Flynn

To: pcs@orsanco.org
Subject: VOTE NO on ORSANCO proposal to drop pollution control standards
Date: Sunday, July 29, 2018 5:17:43 AM

To Whom it May Concern,

Thank you for your time in reading the many emails and letters community members along the Ohio River Valley are sending in response to the proposal to drop pollution control standards. I hope this public input is the single most influential piece in ORSANCO's decision.

I am a lifelong resident of the Ohio River Valley—first growing up in Parkersburg, WV, then moving and working in Wheeling, WV, and now living across the river in Belmont County, OH. Attending Parkersburg South High School, I valued being called “a river rat” and have so many fond memories on the Ohio River—from boating trips, to doing fish studies with my AP Biology class, weddings along the river, my grandmother's river lot home, and probably most meaningful—the many baptisms my father performed right in the river for our church family. We would all sing “Down to the River to Pray” as we walked down to the riverbank and watched as our friends and family members made the decision to join the Christian faith. I'm in tears as I try and explain what that time meant to my young, adolescent mind. It was simple, beautiful, and made a lasting impression on my faith life.

In sharing all these memories, what I'm trying to do is explain that the Ohio River is more than a water way, it's more than an ecosystem even—it's a definitive piece of each residents' life. Without it being protected, without it being cared for, it's as if we are not protecting and caring for the people along its riverbanks. I want my three children to have those same experiences. I want them to be defined by not just living close to the River, but instead having it be an active part of their life. I can guarantee that if pollution control standards are removed, I will not allow my children to experience the water and I am positive I am not the only parent, resident, or tourist who will make that decision—a decision that pains me.

I realize the argument that individual states are already doing a good job protecting the River is factual but my question is what if that stops being true? What if one company, one town, one county, one state along the river becomes lax? If ORSANCO decides to stop controlling pollution, who is next? We, as the Ohio River community, are relying on you to protect the water, it's inhabitants, and the generations of memories to be made on its water and its banks.

Please vote NO on the proposal to remove pollution control standards. I look forward to seeing ORSANCO doing the right thing. Thank you for your time and consideration. Please feel free to contact me at anytime.

Subject: Protect the Ohio River, Too!
Date: Sunday, July 29, 2018 7:36:48 AM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Mary Fauver

ORSANCO holds an important responsibility in pollution control standards. To limit your pollution control standards is to raise the risk of pollution in the Ohio River, source of linking water for millions of people. There is not redundancy in ORSANCO's role. It is part of a tradition of checks and balances that are at the heart of our democracy.

Please reverse the preliminary decision in Option 2.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Jeffrey St. Clair

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

From: [Denise Lytle](#)
To: PCS@orsanco.org
Subject: Pollution Control Standards for the Ohio River
Date: Sunday, July 29, 2018 9:09:32 PM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Date: Monday, July 30, 2018 9:16:00 AM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained; drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, as well as the recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should not be eliminated. One way to reduce cost could be to reform the tri-annual review process into a five-year review process.

Sincerely,

Angie Woods

My name is Elyce Benke, and I care about the health of the Ohio River.

I am writing to urge you to reverse the preliminary decision to go with Option 2.

Please reject any action to eliminate your key role in pollution control standards. There is no redundancy in this role. If there are budgetary constraints, this key function should be maintained above others.

Elyce Benke

This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Kathleen Rackliffe

Subject: Protect the Ohio River, Too!
Date: Monday, July 30, 2018 12:36:50 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Eva Borho

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Angela McGinnis

Subject: Protect the Ohio River, Too!
Date: Monday, July 30, 2018 12:43:07 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Megan McNally

Subject: Protect the Ohio River, Too!
Date: Monday, July 30, 2018 12:45:40 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Pamela Lambert

This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Patrick Potoczak

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Joyce Shadrach

Subject: Protect the Ohio River, Too!
Date: Monday, July 30, 2018 12:59:48 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Bradley Berg

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Barry Goldberg

Dear ORSANCO,

To Whom It May Concern: My name is Kathryn Houseman Lobert. My husband's name is James E. Lobert. I am contacting you on behalf of the two of of us, or 2 sons, their wives, our two granddaughters, or grandson who is due in December as well as others who drink the water from Ohio. I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Toni Crawford

Subject: Protect the Ohio River!
Date: Monday, July 30, 2018 1:47:22 PM

Dear ORSANCO,

I support high environmental standards for the country and state in which I reside. Corporations should not be allowed to pollute water just because it is cheaper not to clean it up. I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). ORSANCO setting uniform standards to protect the drinking water of 5 million people helps everyone through sanitation and preservation.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Fred Powell

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO).

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

It is better to be on the safe side when it comes to the health of the people of our communities, It would be short sighted and irresponsible to weaken the oversight and monitoring of this important source of drinking water.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

Subject: Protect the Ohio River, Too!
Date: Monday, July 30, 2018 3:09:01 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Sonja Jasovsky

Subject: Protect the Ohio River, Too!
Date: Monday, July 30, 2018 4:01:27 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Susan Green

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Subject: HEARING to REVIEW POLLUTION CONTROL STANDARDS
Date: Monday, July 30, 2018 7:35:12 PM

I am an avid environmentalist and my family spends lots of time outdoors and boating on the Ohio River. My children do not understand why we would lessen the protections on our waterways. My family opposes removing the commiissions power to maintain standards. We certainly support the research and data gathering as well. With the current dangers to the EPA, ORSANCO is an additional protection for our water ways.

Please continue to support and protect the Ohio River. We oppose the rollback.

Subject: Protect the Ohio River, Too!
Date: Monday, July 30, 2018 8:07:17 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Sher Patrick

This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Michael Adams

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

Subject: Maintain Orsanco overview of our Rivers
Date: Monday, July 30, 2018 10:41:01 PM

Sent from my iPhone

It is vital to the health of our rivers and the health of the citizens in the 8 state region to continue ORSANCO's overview of the rivers.

In the present political disregard of environmental responsibility it is vital that Orsanco continues to make sure that the Ohio river is healthy and industries are not allowed to pollute it.

Subject: Protect the Ohio River, Too!
Date: Tuesday, July 31, 2018 9:15:14 AM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Laura Rushton

Maintain the October 8, 2015 Pollution Control Standards for Discharges into the Ohio River. Also reject the proposed changes which effectively strip the commission of the power to maintain sanitary standards and safe drinking water for the over 900 miles this river travels within and along 8 states: Illinois, Indiana, Kentucky , New York, Ohio, Pennsylvania, Virginia and West Virginia.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

A multi state organization like ORSANCO is best equipped to properly allocate pollutant loadings and determine what is best for the entire watershed. We need to strengthen that not weaken it.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Please do not rely on Ohio to monitor and enforce water standards. We need a nonpolitical structure to protect our fresh water, perhaps our most important resource. I am against the proposed change that Orasanco give up overseeing monitoring in water quality to the state of Ohio.

From: [J.D.S.&N](#)
To: PCS@orsanco.org
Subject: Public comment for ORSANCO's role in monitoring the Ohio River
Date: Tuesday, July 31, 2018 10:44:56 AM

As someone with a master's degree in Natural Resources and Conservation and a citizen of Ohio, I would like to state my hope that ORSANCO will continue its role in overseeing what goes in to the Ohio River from the eight states that have industrial interests along the river's borders and the overall quality of the Ohio River, on which we all depend. A river does not adhere to state boundaries and I, living in Cincinnati, know that what goes in to the river upstream from us, affects water quality here, as does what we put in affect water quality downstream. I believe that the concerns that led to the establishment of ORSANCO are just as relevant today and with the current Federal assault on the EPA coming from the highest level of our government, we do not want to depend on others to keep our water and our families safe.

I believe that ORSANCO's mission to protect the water quality for everyone along the Ohio River will be best served by keeping ORSANCO's water quality monitoring measures in place. As our country's environmental history record has shown the public over and over, industry will do whatever it can to improve the bottom line, and companies are never beneath polluting the environment to do it.

Sincerely,
Jodie Zultowsky

From: [Randi Pokladnik](#)
To: pcs@orsanco.org
Subject: PCS COmments
Date: Tuesday, July 31, 2018 11:35:44 AM

My name is Dr. Randi pokladnik, I have a Ph.D. in Environmental Studies. I was born and raised in Toronto, Ohio. Where my house was located, we could walk to the Ohio River. I have family and friends living in and around the entire Ohio River Valley from Toronto to Marietta, Ohio.

By 1973, when I was about to go into college, I decided to major in environmental engineering. At that time, If you fell in or went swimming in the Ohio River there was a good chance you would become ill or at the very least surface with an oil slick on your head.

While the river water quality has improved since then, and some industries have been closed down, I can see more dangerous industries in the future especially those connected to oil and gas development. This industry has already affected many communities as we have seen by some other comments made today.

These are not your grandfather's pollutants. These are chlorinated organic hydrocarbons that have the ability to accumulate in fat deposits of humans and other species and cause cancer as well as endocrine disruption. These compounds can cause damage in very small quantities which makes it even more obvious that we need water quality standards set by ORSANCO now more than ever before.

Many of these compounds must be tested by using a gas chromatograph/mass spectrophotometer. I don't feel that the states can be trusted to set standards and carry our monitoring programs that would be equivalent to ORSANCO'S. The states would have to be able to purchase this very expensive equipment, train operators, and interpret results.

Right now our Ohio River is the most polluted in the country. We cannot drink from a toilet and remain healthy but that's what we are being asked to do. The river could become much more polluted and we could witness cancer rates in the valley increasing tenfold.

We owe it to the next generation and to our children to keep vigilant on the water quality of the river. It is interesting that no one representing industry has made a comment on this issue today. Is this meeting just to provide token participation and is the vote for option two already a done deal?

We need to contact our local and state politicians to let them know how we feel about this decision, whether option two is chosen or not we must keep putting pressure on

ORSANCO to maintain its Pollution Control Standards rather than abandoning them. This is about our lives and in my opinion it will cause more harm to communities all along the river if option two becomes a reality.

Randi Pokladnik

Ph.D. Environmental Studies
MA. Environmental and Community Issues

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO COMMITTEE MEMBERS,

I am writing in reference to ORSANCO considering to stop their 70 year program of setting pollution control standards. I feel this would not be a wise decision for the Ohio Valley River communities.

Given that water quality is a major issue on this river and the possible build-up of the oil and gas industry and possible Appalachian storage hub, we need the oversight that ORSANCO provides now more than ever.

Please consider adopting options 4 and 5 rather than abandoning the PCS.

Sincerely,

Joel Pokladnik, P.E. retired U.S. Army Corps of Engineers

Subject: Proposed Elimination of Pollution Control Standards for the Ohio River
Date: Tuesday, July 31, 2018 2:37:05 PM

I am submitting this comment as a regular boater and user of the Ohio River.

It is my belief from close observation of the river on a regular basis that there are numerous violations of pollution standards that are still not being addressed.

Whether or not the EPA regulations are sufficient to control these issues if they were properly enforced is for the experts to decide, not me.

However, it is my belief that ORSANCO has played a major role in attempting to control pollution to date and rather than scaling back needs to now take this to the next level.

I'll leave you as the experts to decide whether this needs to be achieved by more regulations. But believe me the river has lots of problems that need to be addressed and ORSANCO can do a lot better than any other organization at tackling these issues if it chooses to push for greater enforcement at the local level by all member states.

Issues that I observe needing enforcement and cleanup include raw sewage overflows, fertilizer runoff, industrial pollution, and massive quantities of garbage.

Please do everything in your power to make the river cleaner. We need it.

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Christieanne Bergey

Subject: monitoring water quality
Date: Tuesday, July 31, 2018 5:10:57 PM

My wife and I are concerned that the triennial review process conducted by the Ohio River Valley Sanitation Commission may be discontinued. Given all the algae that is washing up in Florida, Lake Erie and other places, it seems clear to us that water quality needs to be monitored on a continuing basis by a body that can see "the bigger picture." To relegate pollution control to the individual states will not protect the Ohio River in the most effective manner.

We emphatically implore you to keep the current criteria/standards of review.

Thank you for your consideration.

Sincerely,
Len and Judy Deutsch

I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

I read that you are proposing to ELIMINATE your pollution control standards for the Ohio River, believing that the bordering states have standards that will protect the river and the people along it.

This is not true. ORSANCO has been (and we are grateful!) doing scientific research to determine the safe level of a lot of chemicals for years. Indiana is FAR BEHIND. Other states may have better research and regulations than we do, but you have standards for more than 100 chemicals that Indiana does not. Clearly, going from an existing standard (when research obviously supported instituting such a standard) to none is not a step that would benefit the health of Hoosiers.

As a Hoosier, I am asking you PLEASE not to take this drastic step.

Yours sincerely,

This is no time to shirk your responsibility for keeping the Ohio River a safe source of drinking water for 5 million people. If anything, experience has shown us that corporations in the energy industry are careless in their operations and criminally negligent when people's lives are at stake. In fact, our monitoring of toxins in our waterways should be expanded to include even more chemicals given the lack of transparency required of oil and gas companies and their poisonous "proprietary formulas".

This is a massive tragedy waiting to happen. Don't look to save pennies now while gambling on incalculable costs in the future.

I strongly disagree with the OHIO River Valley Water Sanitation Commission to stop setting water quality standards. If our state and federal laws are so good, then why were there so many violations discovered. The truth is that these big companies want to pollute our river more. Meanwhile, thousands of people, that rely on river water for drinking, will be drinking polluted water. We cannot continue to allow our fresh water sources to be used by factories, chemical companies and cracker plants. Our fresh water sources are becoming scarce, and we need water to survive. Catering to these big companies at the expense of our lives has to stop!

Subject: PCS Comment
Date: Wednesday, August 01, 2018 10:47:15 AM

Dear ORSANCO,

This letter is to oppose the proposed changes to the 2015 Pollution Control Standards. These give specific, scientifically justified standards for water quality along the Ohio.

- The proposed document, reduced to 10 pages, leaves it to each state to interpret the regulations, likely favoring local industries over other states that will suffer from addition discharges into the river.
- It is unlikely that each state will take the time or expense to replicate the scientific research that forms the basis of the 2015 standards.

ORANSCO fulfills a critical government function of protecting the environment, and should continue this mission, with no changes to the 2015 act.

Sincerely,
Christine Perlin

To: PCS@orsanco.org
Subject: Proposed Changes to the Pollution Control Standards for Discharges into the Ohio River
Date: Wednesday, August 01, 2018 11:25:55 AM

This letter is in response to the proposed dropping of pollution control standards of the Ohio River Valley Water Sanitation Commission (ORSANCO), due before midnight, August 10, 2018.

We must not change the current standards for pollution control of discharges into the Ohio River to defer to the states agencies that regulate these discharges. A key reason that the Ohio River has improved over the last several decades are the ORSANCO standards. The reason for ORSANCO is that the states individually do not sufficiently regulate these discharges and all are dependent on a joint set of standards. In the face of the rollback of federal environmental regulations it is essential that the 8 states maintain the standards that they have enacted through ORSANCO.

I grew up about 1/2 mile from the river. It was so contaminated from dumping chemicals and sewage that it was not safe to even boat in. After all these years, you want to go back? Are you kidding? We want this left alone. Let them to continue to manage and check the pollution levels. Don't let anyone or any company to destroy this beautiful river. Marilyn Maffet

This letter is in response to the proposed dropping of pollution control standards of the Ohio River Valley Water Sanitation Commission (ORSANCO), due before midnight, August 10, 2018.

We must not change the current standards for pollution control of discharges into the Ohio River to defer to the states agencies that regulate these discharges. A key reason that the Ohio River has improved over the last several decades are the ORSANCO standards. The reason for ORSANCO is that the states individually do not sufficiently regulate these discharges and all are dependent on a joint set of standards. In the face of the rollback of federal environmental regulations it is essential that the 8 states maintain the standards that they have enacted through ORSANCO.

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO ORSANCO,

As a constituent, I'm writing to express my concerns regarding the proposed changes to the Pollution Control Standards for discharges into the Ohio River.

ORSANCO's proposal to eliminate pollution control standards and withdraw from the process of maintaining and updating the standards moving forward is not acceptable. This approach jeopardizes the ongoing clean up and restoration of the Ohio River and is counter to the original 1948 compact that outlined the importance of watershed-wide cooperation through a joint or common agency.

The Ohio River is at a critical juncture, again topping the list of most polluted rivers in the country. Eliminating these standards puts approximately 5 million Americans' drinking water and approximately 25 million people's quality of life and local economies at risk.

It is imperative for the Commission to uphold its responsibilities to ensure the protection and restoration of the Ohio River and the millions of Americans who depend on the river for drinking water, the numerous businesses, and approximately 25 million Americans quality of life. Everyday we wait to protect and restore the Ohio River the problems become more complex and the solutions more costly. I strongly encourage ORSANCO to uphold its responsibility and protect the Pollution Control Standards, rather than rolling back protections for one of the nation's most important resources.

Benny Sutcliffe

Sincerely,
Benny Sutcliffe

To Whom It May Concern:

I am writing to plea with ORSANCO to not relinquish it pollution controls of the Ohio River to the states. There are no dividing lines with water. The very thought of not having uniform control over the Ohio is ludicrous! Some states, maybe all, would allow toxic discharge levels to increase to entice industries to their state. Who suffers? Every creature, including humans, that utilizes the river. If one state loosened pollution controls, what would be the incentive for any other state to maintain theirs.....none. Please do not relinquish your control of this river. All of us depend on the Ohio for life giving water.

Thank you,
Mary Lineberry

From: [Thinking Thomas](#)
To: PCS@orsanco.org
Subject: ATTN: Public Comments
Date: Wednesday, August 01, 2018 2:39:23 PM

1 August
2018

To the Ohio River Valley Sanitation Commission:

This letter is submitted as public comment upon the proposed revisions to the 2015 Pollution Control Standards (PCS) with whose enforcement the Commission is tasked.

Following the scarcely publicized round of initial public comment, [five alternative facts](#) towards those revisions have been advanced as on the table, with the majority of the commissioners apparently in favor of the second on that list. This is a lamentable situation indeed as the very presence of alternatives one, five, and two is difficult to read as anything but an effort on the part of the Commission to evade its responsibilities under the mandate of the Ohio River Valley Sanitation Compact (ORSANCO) to carry forth its work by the “the guiding principle... that pollution by sewage or industrial wastes originating within a signatory State shall not injuriously affect the various uses of the interstate waters.”

Certainly, such an abnegation is the all but explicit intention of Alternative One which is directed to “Terminate ORSANCO’s PCS and rely upon state and federal programs provided for and mandated under the Clean Water Act and related state statutes.”

Alternative Five (a “Provision for states to consider the PCS when developing state water quality standards”) is not so blatant. In lieu of calling for their outright elimination, it would be satisfied to only deprive those Standards of legal force by rendering them as points of mere “consideration” rather than mandate. Still what is happening there is patent enough.

Alternative Two (deemed “Clean Water Act Alternative to ORSANCO PCS Rules”) though is additionally an offense against the public by effecting the same purposes of its pernicious cousins one and five, though through less obvious mechanism. Matter of factly, it meekly posits the deletion of Chapters 3 through through 5 of the PCS, neglecting to note along the way that Chapters 3 through 5 constitute not only over 72% of the document, but that their content is what directs force to the specific matters of the Ohio River’s water quality. The odium elicited by this cheap legerdemain is but intensified by its accompaniment by the grossest legal sophistry. The language of Alternative Two states the following:

Unlike designated uses and wastewater discharge requirements, water quality standards and mixing zone are not mentioned in the Compact. As was observed in the “Report of the ORSANCO Ad Hoc Water Quality Standards Implementation Committee”, dated May 11, 2015, “the Compact

never mentions the term “water quality standards”...

Perhaps the authors of the Ohio River Valley Sanitation Compact can perhaps be forgiven for not anticipating such a narrow reading of their intent, especially by an Ad Hoc Committee itself charged with a consideration of Water Quality Standards.

Alternatives One, Two and Five are to be dismissed then out of hand as at egregious odds with the very purpose of ORSANCO. Alternative Three and Four are little better. Alternative Three (entitled “Cost Effective Alternative for Standards”) calls for the implementation of a Cost Effectiveness Standard for evaluating and modifying PCS under the rubric of harmonizing standards across States and through to the Federal Level. Superficially, this sounds benign. However, it is potentially quite harmful. In the first place, by prioritizing a criterion of cost effectiveness, it implicitly gives first weight not to the health of the Ohio River Valley, but to the logic of the market. This is a grave error as the latter notoriously cascades into environmentally destructive activities, a circumstance to which the very institution of ORSANCO in 1948 gives testament. Yet, moreover, the latent premise is that redundancy of standards is always a problem. However, any engineer worth his salt realizes the faultiness of this presupposition. Given the tendency of industry to find whatever means it can to circumvent restraint, redundancy is often actually advisable as a throttle to pollution.

Alternative Four (“Selectively modify PCS after review as warranted and increase focus on harmonization of standards and their implementation among Compact states and EPA”) is essentially but a muted version of Alternative Three, with the only advantage accruing to it being its acknowledgement that a case-by-case approach to such matters is the only sensible one. For it is only on a case-by-case basis that effective discernment of what is ecologically advisable can be realized. However, the merit of that advantage is countered by the inclusion of insistence upon a project of ‘harmonization’ of standards. That project falls by the way of the same objections we have raised in connection with Alternative Three.

In reality, none of the Alternatives put forth for the revision of the 2015 Pollution Control Standards deserve ratification. The sane course would be simply to leave the standards as they are, or to draw up a new list of possibilities, one which actually strengthen those Standards in a way that could alleviate the Ohio River of the ignominious title it now holds as the most polluted inland waterway in the United States.

Sincerely,

Thomas Leo Patrick Lynn, Jr.

Without going into any technical discussion, I have a question: Are you people nuts? Standards represent the police officer in the rearview window. If you have no standards states will not continue to enforce what we currently have. They will go back to what they were doing before. If we have no laws, regulations or standards they is nothing to follow. Also think about all the different standards each state may try to implement? How is one set of standards to be enforced? If one state sets no or very low standards, how does the next state downstream get the other state to up their standards?

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Ronald Hedrick

You absolutely cannot increase the pollution of the Ohio river. We cannot keep destroying the world we live in. We are making it uninhabitable for future generations. We need to protect the river and make sure that we don't add the the amount of chemicals we are dumping in it.

Sincerely,
Maya Jamner

From: [Cliff or Nora Johnson](#)
To: PCS@orsanco.org
Subject: ORSANCO regulatory authority
Date: Thursday, August 02, 2018 6:53:20 AM

To whom it may concern:

It has come to my attention that the Ohio River Valley Water Sanitation Commission (ORSANCO) is debating whether to discontinue its triennial review process of the Ohio River's quality of water.

I urge the commission not to discontinue its authority to regulate pollution in the Ohio River. You have too important a role to play in improving the quality of water, the drinking water source for more than five million people.

Since 1948, ORSANCO has served the public by controlling and abating pollution in the Ohio River Basin. It operates programs to improve water quality in the Ohio River and its tributaries, including setting waste water discharge standards, performing biological assessments, monitoring for the chemical and physical properties of the waterways, and conducting special surveys and studies.

Currently, the water quality of the river is being threatened as result of the boom of oil and gas drilling in the tri-state region. The proposed Appalachian Petrochemical Storage Hub near Monroe County Ohio would collect fracked gas and other heavier hydrocarbon liquids from the tri-state area via a six-pack of pipelines running 386 miles along the banks of the Ohio River from Monaca, PA. through West Virginia to Catlettsburg, KY.

The facility would pull millions of gallons of water from the river to create storage caverns by dissolving salt deposits. It would also produce millions of gallons of salty brine which will be held in a pond adjacent to the Ohio River.

There are also plans for the construction of up to six huge ethane cracker facilities similar to the one being built in Monaca, PA. which would manufacture 1.6 million tons of plastics a year. They could also discharge oil, benzene, and phthalates into the Ohio River.

If this storage hub, cracker plants, and the additional industries associated with them become a reality, the Ohio River would receive even more industrial pollution. At a recent petrochemical industry conference, one engineer admitted that the state regulators in Ohio, Pennsylvania, and West Virginia have "little experience with natural gas liquids storage facilities of its size" and that there are "few regulations as well."

During a time when federal environmental regulations are weakened on a daily basis, our communities need the protection that ORSANCO's Pollution Control Standards provide. We need to speak up or those standards may disappear

I strongly disagree that state-level pollution control standards are adequate even at this time, before the petrochemical operations have been built. The water of the Ohio River is not clean: this drinking water source has been named the most polluted river in the USA for the past seven years. In 2014, more than 24 million pounds of industrial wastes and chemicals were dumped into the Ohio River. That's twice as many pollutants by weight as was put into the Mississippi River.

ORSANCO sets baseline standards for many chemicals that are discharged into the Ohio River at hundreds of points along the 981- mile-long river. Some of these standards go beyond what U.S. EPA and state regulatory agencies require.

Several states rely on ORSANCO's standards and adopt them as their own. If ORSANCO no longer sets these standards, those states will have to expend the financial resources to develop the requisite standards.

If all Ohio River states have to develop their own standards, then the situation can lead to interstate conflicts when an upriver state has weaker standards that lead to increased pollution treatment costs for a

downriver state. This would, inevitably, lead to litigation among the states.

ORSANCO should be setting uniform standards with the collective input of all basin states.

Thank you very much for your consideration.

Nora Johnson

Subject: reducing pollution controls on the Ohio River
Date: Thursday, August 02, 2018 8:29:02 AM

I am opposed to reducing/eliminating pollution controls on the Ohio. Why in the world would we want to do that????? I remember how foul the river was back in the 60's and 70's and why would our country want to go back. In this terrible era of Trump, we keep going backwards. Once a resource has been fouled or destroyed, there is no getting it back.

Do the right thing and maintain stringent pollution controls on our waterways.

To: PCS@orsanco.org
Subject: Oppose relaxed water standards in the Ohio River
Date: Thursday, August 02, 2018 8:34:32 AM

I live in Louisville, Kentucky. I get my drinking water from the Ohio River.

I am writing to express my opposition to the proposal by ORSANCO to amend its Pollution Control Standards (PCS) by eliminating water quality standards and criteria, as well as mixing zone and wastewater discharge requirements, from the rules, and by making changes to other sections of the PCS.

I believe we need an independent body that is able to research, develop, propose, and adopt standards tailored to the specific needs of the river in an atmosphere that stresses sound science and data-driven policy.¹ In Louisville, we rely on water from the Ohio River and we count on ORSANCO and its PCS to help keep it clean.

Clean drinking water is the most basic of human needs. The Ohio River provides water to millions of Americans. If anything, let's err on the side of strict policy that protects our citizens, rather than loosening restrictions that may put us at risk.

Thank you.

I am writing to express my opposition to the proposal by ORSANCO to amend its Pollution Control Standards (PCS) by eliminating water quality standards and criteria from the rules, and by making changes to other sections of the PCS.

I have lived in Louisville for 35 years and have seen the Ohio River become noticeably and dramatically improved by enforcement of environmental standards. It has become a keystone of Louisville's economic development strategy to make the waterfront more appealing and the Ohio River more accessible. Relying on an EPA that is under fire from the Trump administration to ensure water quality would be a major setback to the future growth of Louisville.

Even more importantly, we rely on water from the Ohio River and we count on ORSANCO and its PCS to help keep it clean. Please vote to keep ORSANCO's role unchanged.

Thank you,

Nina Walfort

Subject: Lest we forget!
Date: Thursday, August 02, 2018 10:26:28 AM

There must be no change to the current standards for pollution control of discharges into the Ohio River, or movement to defer to the states separate agencies that would thus regulate these discharges in a state by state manner. A key reason that the Ohio River has improved over the last several decades are the ORSANCO standards. The reason for ORSANCO is that the states were known to end up deciding independently. Doing this causes insufficient regulations for discharges. A lack of cooperation has shown in the past that all flows steaming on an on past state lines are not healthy Ohio River flows. Rollbacks of federal environmental regulations can not become the basis to not allow what is essential to remain. And that is the 8 states maintaining the standards that they have enacted through ORSANCO.

Lest you forget the Ohio River of 1937 please check out this link-

Dear ORSANCO,

One of our nation's Greatest gifts and greatest strengths is our clean water. Without health, people cannot be productive. I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Martha Rogers

Please don't strip the Ohio River protections. The river has improved with these protections and needs to continue to do so. People need to know that their drinking water is safe. People also use the river for recreational purposes and relaxing the protections would make the water unsafe for fishing and swimming. I am old enough to remember when the river was a beautiful turquoise and clear. I watched it become a brown mess. Hopefully, it can someday return to it's former beauty, but not without protections.

Subject: Option 2
Date: Thursday, August 02, 2018 12:06:47 PM

My name is Teresa Vandergraff
My address is 3090 Candlewood Court Erlanger, KY 41018
Cell phone number is 859-445-2262
I'm a registered voter in Kentucky's 4th congressional district

I highly oppose Option 2. The removal of pollution standards for the Ohio River and control from the eight-state commission that oversees water quality along the Ohio River which is the drinking water source for 5 million people along the 981 mile waterway would be devastating. Leaving the fate of what happens to us and what poisons we may be exposed to to the Trump administration is wrong. The federal government's standards are not strict enough to protect us. Please throw out this proposal and leave things at the current standards with the current commission overseeing it.

Thank you, Teresa Vandergraff

RE: .Water Quality Standards Threatened

To Whom it May Concern:

I am a resident of Louisville, KY and I am writing to express my opposition to the proposal by ORSANCO to amend its Pollution Control Standards (PCS) by eliminating water quality standards and criteria, as well as mixing zone and wastewater discharge requirements, from the rules, and by making changes to other sections of the PCS.

I the minority report indicates that there are nearly two hundred parameters among the six signatory states and EPA, for which ORSANCO has a criteria but the state or EPA does not. If that is true, how can anyone conclude that the ORSANCO standards are redundant? I also agree with the minority report that we need an independent body that 'is able to research, develop, propose, and adopt standards tailored to the specific needs of the river in an atmosphere that stresses sound science and data-driven policy.' In Louisville, we rely on water from the Ohio River and we count on ORSANCO and its PCS to help keep it clean."

Thank you,

Erica E. Turner
Louisville, KY

Subject: Comments on proposed changes
Date: Thursday, August 02, 2018 11:37:12 PM

I attended the Orsanko public review meeting in Kentucky, July 26. I did not speak publicly at the meeting but would like to add some comments now:

1. The Ohio River is so polluted that it requires a uniform set of standards to try to control its hazard level. To allow each state to set its own guidelines, the proposed option, is to allow for contradictory standards
2. Despite the high levels of pollution in the river, Orsanko has a proud history of providing protective measure for the river, based on scientific knowledge. Probably no state can do this on its own. Why not continue what has been done?
3. There are future concerns that may require united action by all affected states. In particular the possibility of providing storage areas for Fracking products is a real concern. If located near water, this could lead to contamination of our rivers. A united effort, as provided by Orsanko, is the best way to deal with these concerns
4. It was a bad mistake to have just one public meeting. There should have been a meeting further upstream and further downstream. This makes it appear that the effort is to avoid public discussion.

I hope that Orsanko will not go forward with the proposal to allow each state to provide its own guidelines. I support alternatives #3 and or # 4

August 1, 2018 ORSANCO Commission, Please maintain the October 8, 2015 Pollution Control Standards for Discharges into the Ohio River. The standards are necessary to maintain and improve the sanitary standards and safe drinking water for millions of people. Water is the single most important commodity in our lives. Please reject the proposed changes as this could do irreparable damage to the people, wildlife, environment. CDC has stated over 900,000 people become ill each year due to contaminated water. Removing the restrictions will only increase that number. Please maintain the October 8, 2015 restrictions. Thank you, Geoffrey and Mary Arth

Subject: Concern about Changing Pollution Standards
Date: Friday, August 03, 2018 8:55:31 AM

I am concerned about the proposed change in pollution standards for industrial and municipal wastewater discharges into the Ohio River. I feel this is a huge safety concern for the residents that rely on the river for drinking water, cooking water and even bathing. We can ill afford more pollution. I realize that deep pockets are most likely pushing this but someone has to voice concerns of the average citizen. May I remind you of Flint Michigan and the problems this community is still trying to overcome by someone's short sighted decision.

Based on what I understand this could affect the safe drinking water and sanitary standards in over 900 miles of river along 8 states including my state Kentucky. Additional polluted water affecting people and industry as well as Farming, bourbon, etc.

I strongly urge a step back on this decision. I am just one concerned citizen. Remember your decision could affect your own families and future generations as well.

Thanks for your time.

Subject: Retain Numeric Pollution Limits for Ohio River Basin
Date: Friday, August 03, 2018 9:15:12 AM

To Whom It May Concern:

Since 1948 the Ohio River Valley Sanitation Commission (ORSANCO) had worked with member states to improve water quality in the Ohio River Basin, in part by to setting pollution limits. This work has been critical in making sure that pollutant discharges into the Ohio River in one state don't have a negative effect on the downstream waters of another state. I am writing to express my concern regarding the proposed discontinuation of the important practice of ORSANCO setting numeric pollution limits for the Ohio River Basin.

If ORSANCO's commissioners abandon the critical work of overseeing the pollution limits as they have these past decades, we will not be able to say how much pollution is too much, and the quality of citizens' drinking water may be jeopardized. In addition to this public health concern, in the absence of meaningful pollution limits, the potential for a polluted Ohio River could damage states' economies through reduced recreational opportunity.

I urge ORSANCO to continue its current practice of setting pollution limits for the Ohio River Basin.

Thank you.

Sincerely,
Margaret F. Jamner
Louisville KY

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Chris Anderson

Hello friends,

I live in Louisville, KY, Metro District 9, which borders the Ohio River and includes Louisville Water's Zorn Pump Station.

I am writing today to express my opposition to the proposal by ORSANCO to amend its Pollution Control Standards (PCS) by eliminating water quality standards and criteria, as well as mixing zone and wastewater discharge requirements, from the rules, and by making changes to other sections of the PCS.

My family drinks and relies on water from the Ohio River, as do many 100,000s in the region, and we count on ORSANCO and its PCS to help keep it clean.

Thank you for listening to my concerns,

Zach Bramel
Louisville, KY 40206

From: [Jacobs, Lorie](#)
To: PCS@orsanco.org
Subject: Clean Water standards
Date: Friday, August 03, 2018 12:41:11 PM

Dear Ohio River Valley Water Sanitation Commissioners,

I recently heard from Louisville Metro Councilman Bill Hollander (District 9) that there is talk to amend Pollution Control Standards (PCS) by eliminating water quality standards and criteria, as well as nixing zone and wastewater discharge requirements from the rules and making changes to other sections of the PCS.

I urge you to please think carefully about the proposal. Clean water is a necessity for human flourishing. I have a feeling good old American greed is at work here. Not every company or individual is responsible and, because of the propensity to do what is convenient or cushion a company's bottom line, ORSANCO needs to lead by strong example. Help keep the water in the Ohio as safe as it can be!

If restrictions are eased or done away with all together the cost will eventually be passed on to the utilities to research and implement new ways to keep our drinking water safe. The Louisville Water Company is already doing so much already. To add to their burden will cost us more. Hold the right people accountable. It starts with you.

Sincerely,

Lorie A. Jacobs

Hello,

Just wanted to express how important the Ohio River is to me, and how much I wish for a day that we can swim, boat, fish and enjoy the river without fear of the quality of the water and the dangerousness of the pollutants therein. I live 100 feet from the River in a cabin and also boat on the ohio as much as possible. I feel like the protections need to increase and not decrease on the ohio. I just wanted to add this to the discussion of whether to scrap federal protections on the waterway. I think that is short sighted and dangerous to the health of the river and by extension the people who live, work and recreate on the river. Please feel free to contact me about this. I love the Ohio, and believe that we need federal as well as state regulation of pollutants in the Ohio.

Thanks

Jess Myers

Sir or Madam, the following proposed regulation changes for the Ohio River are unacceptable for the integrity of our drinking water and stewardship of the river and ecological systems. To disregard the health of our waterways is to disregard our own health and lives; it is reckless.

ORSANCO (Ohio River Valley Water Sanitation Commission) is accepting comments by emails and letter on the proposed changes in regulation which will strip the commission of the power to maintain sanitary standards and safe drinking water for the over 900 miles that the Ohio River travels within and along side eight states.

Respectfully,
Judy Sharer

Hello,

I am a Louisville resident who lives and works within a couple of miles of the Ohio River. I am writing to oppose the the proposal by ORSANCO to amend its Pollution Control Standards (PCS) by eliminating water quality standards and criteria, as well as mixing zone and wastewater discharge requirements, from the rules.

The minority report explains that there are almost two hundred parameters among the six signatory states and EPA, for which ORSANCO has a criteria but the state or EPA does not. ORSANCO standard are not redundant - in fact, they are critical. We absolutely need an independent body with the ability and authority to research, develop, propose and adopt standards that are tailored to the specific needs of the Ohio River. We rely on ORSANCO and its Pollution Control Standards to keep the water of the Ohio River clean.

Thank you.

Sincerely,
Anastasia Kaufmann

Date: Sunday, August 05, 2018 1:54:32 PM

I want the Ohio River to be under the watch of ORSANCO and NOT pass this important task, one that you have been doing since 1948 off to ill equipped and under funded state programs.

ORSANCO has taken 70 years to create these standards, why drop them now?

We need these more than ever because of oil and gas infrastructure coming to the Ohio Valley.

We need more public hearings.... one in the upper basin and one in the lower. this is the drinking water source for 5 million + people.

There are close to 200 criteria that some states do not even test for.

The budget to fund this task is SMALL compared to the total budget and this is one task that is critical to the health of our families.

Best regards,

Patrick J. O'Connor

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Susan Wagner

ORSANCO
Attn: PCS Comments
5735 Kellogg Avenue
Cincinnati, OH 45230

PCS@orsanco.org.

My name is Donald R. Criss. I have an M.S. in Geology. I have worked for the WV Dept. of Environmental Protection for 24 years now, focusing on groundwater remediation. I have done extensive research regarding the impact of endocrine disrupting contaminants in ground and surface waters. I wish to express my concern over the proposed revisions to key pollution control standards. We are all aware that pollution does not stop at political boundaries. That is why the need to preserve consistent water quality standards throughout the Ohio River has never been more urgent. Without consistent water quality standards throughout the watersheds, individual states and local entities will be free to set their own pollution standards that will inevitably conflict with common sense goals of maintaining the viability of our water resources. Without broader oversight, we can expect water quality standards to be dictated by short sighted economic policies.

Development of deep well fossil fuels and the Appalachian Storage Hub poses much more risk than benefit. Massive water extraction and disposal of used fracking fluids threaten the viability of our water resources, as well as the pollution at cracker/processing plants. These are chlorinated organic hydrocarbons that have the ability to accumulate in fat deposits of humans and other species and cause cancer as well as reproductive disorders and endocrine disruption. These compounds can cause damage in very small quantities. which makes it even more obvious that we need water quality standards set by ORSANCO now more than ever before.

Many of these compounds must be tested by using a gas chromatograph/mass spectrophotometer. Individual states cannot be trusted to set standards and carry out monitoring programs that would be equivalent to ORSANCO'S. The states would have to be able to purchase this very expensive equipment, train operators, and interpret results. The states have shown they are more inclined to overturn or ignore efforts to protect our waters.

Without abundant clean water, we will have no economic development, no quality of life, no way to simply live on our lands. Our water resources are truly more precious than gold. We are being asked to roll the dice with our most valuable resource so the wealthy few can become even richer.

We owe it to the next generation and all future generations to keep vigilant on water quality. Bear in mind more than four million people drink from the Ohio River.

ORSANCO must maintain its Pollution Control Standards rather than abandoning them.

Sincerely,

Donald R. Criss

Hello,

The ORSANCO pollution control standards are powerful tools to protect the Ohio River - and it needs protecting! Please do not eliminate them! Indiana's own Clean Water Rule standards defer to them in order to do our part helping to keep the river safe for enjoyment of people and wildlife habitat. That would leave Indiana with a harmful gap in Ohio River environmental protectios. Let's be a good neighbor. Protect the river.

Respectfully submitted,

Subject: ORSANCO pollutions standards proposal
Date: Monday, August 06, 2018 4:44:52 PM

We are totally opposed to the proposal to eliminate ORSANCO'S water pollution control standards for industrial and municipal wastewater discharges into the river.

The States working together has resulted in improvements in the Ohio River, but much remains to be done. We live in Newburgh, Indiana, and see first-hand how important our river is to so many people.

We don't understand how you can even consider weakening protections to a river that provides drinking water for 5 million people.

One argument in favor of weakening ORSANCO's standards is that they are covered under the Clean Water Act. But according to one ORSANCO report, there are 188 instances where state and federal rules are not redundant to ORSANCO's.

Also, the Trump administration has been working steadily to eliminate environmental protections included in the Clean Air Act, Migratory Bird Treaty Act and Clean Water Act in favor of industry. We need ORSANCO's standards now more than ever because of the Trump Administrations' total abdication of protecting our environment.

This river is a valuable resource of millions of people, not just industries to do with as it pleases.

We urge you to reject this proposal to weaken standards for the Ohio River.

On Aug 2, 2018, at 9:38 PM, Ben Fessler <bencarolfessler@yahoo.com> wrote:

First let me say if this is a duplicate email I'm sorry. Next let me say I don't normally do this but think the following info is important.

The Ohio River may soon lose virtually all pollution-control and quality standards set by the Ohio River Valley Water Sanitation Commission. Charged with protecting the river and ensuring the water is safe for drinking, fishing and recreation, the commission voted to move forward with an industry backed proposal to eliminate pollution standards for industrial & municipal wastewater discharges into the river. This affects the safe drinking water and sanitary standards in over 900 miles of river along eight states including Kentucky.

The ORSANCO Commission is taking public comments by mail or email on the proposed change in standards until midnight Aug. 10. PLEASE ASK ORSANCO TO REJECT THESE PROPOSED CHANGES AND KEEP OUR DRINKING WATER SAFE.

I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Nancy Bernstein

From: [Kimberly Wiley](#)
To: PCS@orsanco.org
Subject: Pollution Control Standards for the Ohio River
Date: Monday, August 06, 2018 11:50:06 PM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Please keep the regulations in place to prevent chemicals from being dumped into the Ohio River. I live on the river and know the beauty of geese paddling upriver for their daily sunset 'cruise'. I watch beavers, herons, and turtles in and around the river. Last week I witnessed a magnificent eagle snatching a dead fish from the banks of the river. Thousands of people kayak, canoe, paddle board, ski, swim, boat, knee board, wake board, fish and enjoy the summer activities along the Ohio. Most importantly we all drink the water and deserve clean water.
Thank you,

I am writing to urge you to maintain the October 8, 2015 Pollution Control Standards for discharges into the Ohio River. I hate to think that we would return to the old way of dumping industrial waste into the Ohio. I am a lifelong citizen of Louisville and a senior citizen. I would like to leave the world, especially the Ohio River, a better place than it was when I was growing up. The people who rely on the Ohio River for clean water deserve and need clean water. Please do not accept this proposed change in standards. Thank you very much. J.G. Hans

<p>I understand from the Sisters at Ursuline Collage, Louisville, Ky that you are relaxing the requirements for release of toxins into the river. I am appalled at this. I know that some of the requirements have been very restrictive but that really is not the issue since long term it is necessary. When I was younger I thought that ORSANCO was a leading edge in the fight against pollution and I am sorry for the short sightedness of our culture that has made this an issue. I am a retired organic chemist and I understand the chemical make up of our water and its effect on health for our future generations and its potential devastation if is not controlled.</p> <p>Michael Ritchie</p>

Subject: Pollution Control Standards for the Ohio River
Date: Wednesday, August 08, 2018 1:36:16 PM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Jacqueline Fannin

Dear ORSANCO Commission members, I am writing to urge you to reject the proposed changes to strip the Commission of its power to maintain sanitary standards and safe drinking water levels for one of the most important river systems in our nation. You should be proud of the work you have done in the past to uphold these standards and have the strength and foresight to continue to do so in the future. We, as citizens of the eight states that border the Ohio River, are lucky to have such a commission to hold those potential polluters to a higher standard. We certainly do not want to revert to conditions such as those in the 60's and 70's (think Cuyahoga River). Thank you! Robin Lucas

Dear commission members,

I live on the Ohio River in Evansville, IN and I believe that the commission needs to continue to monitor the health of the river. The reasons that I believe the commission is needed include that oversight is important because one state could change what it is doing without the consideration of how the changes could and will impact other states. Under the current administration, the EPA is easing or lifting guidelines that help to protect the health of our waters. Please do not let the improvements that have been made be lost by less control and oversight! Our health depends on the health of our environment.

Hello,

I have lived in Cincinnati for over 20 years and have lived in the area in years prior. I know the importance of having a clean river for water and recreation and the environment. I really think that ORSANCO has a few other standards and an oversight ability that few river systems have. I realize that many feel that with the Federal EPA and State EPA, that we have enough regulations however I think we should have a third set of eyes on this invaluable resource. We have made progress but we don't need to back step now. If we cut funding to this vital organization, we will lose in the long run. Every state will be able to make exceptions to the regulations and by pass the rules. We need river monitoring by a special unbiased organization.

Please do not redline or delete all of your regulations and monitoring.

thanks
Sherrie Heyse

From: [Millermc](#)
To: [PCS](#)
Subject: Reject ORSANCO Commission Proposal #2
Date: Friday, August 10, 2018 10:37:33 AM

Objection to Proposal #2 to relinquish the power of ORSANCO to regulate and enforce water quality standards on the Ohio River and its watershed.

By Michael C. Miller, Emeritus Professor of Biological Sciences and Environmental Studies, University of Cincinnati 1970-2010. Vice President of Rivers Unlimited and of Friends of the Great Miami, Board member of Mill Creek Alliance, Oxbow, Inc and coordinator for Green Umbrella's Watershed Program database STEAMBANK

As one who has studied the chemistry and biology of the Ohio River since 1970 after the implementation of NEPA (1968) and after the Clean Water Act (1972), I have seen the recovery of the Ohio River with US EPA standards adopted and enforced by our interstate compact ORSANCO. Their systematic collection of data from fish to water chemistry has allowed us to connect data with results in better biological diversity in a man-manipulated watershed. When this movement started protecting fish, benthos and macroinvertebrates with limits that safeguard LD50s were good enough to get started. But today we are looking at interactions between several potential chemical, biological, and physical stressors on our rivers system that may interact with climate change to challenge the now old fashion method of single chemical limits. The proposal to give up the power to set and promogulate water quality standards for the Ohio River mainstem and by default many of the tributaries, the ORSANCO board proposal 2, and remove ORSANCO from evaluating the effectiveness of those standards every three years will potentially weaken our ability in government to control the destiny of the Ohio River.

Ohio River-specific problems include: response to climate change (elevated temperatures, reduced oxygen saturation, low flows, pulsed flows), control of invasive species (Silver carp, Black carp, and , already in the system) and potential invaders (Great Lake gobies, European ruffe), inability to respond to unique problems with the Ohio River (spills, barge ports, transport of hazardous fracking waste, etc.), unique discharge problems from one state that may have degradative impacts on the biota of another state, inability to respond to more dredging as sand becomes limiting for development nationwide, endangered species enhancement at water quality standards different than the USEPA national standard.

In addition we have found out recently how vulnerable our environmental laws are to attacks from high federal office for political and non factual reasons, that may not be advantageous to the biotic health of the Ohio River, when those deviations from current standards are designed to favor one industry. We have both state EPAs and our federal water quality standardds; however these are generalized for human health and recreation and for health of the native organisms usually over the whole state or national ecoregion, but these controls cannot respond to unique problems in the Ohio River, or standards that may vary along the river required by the differences in chemistry from runoff from metamorphic rock to

sedimentary rock from upriver to down river. We need the third layer of support for the states in the Ohio River drainage, just like the Upper Mississippi River drainage.

The review of standards every three years could be changed in the charter by the Commission to once every 5 or 7 years to reduce costs, more consistent with the Ohio and federal EPAs. This reduction in frequency of review should reduce the annualized costs over the once in three year reviews, saving ORSANCO money. They could adopt federal EPA water quality standards for the most part where deemed appropriate, but would reserve them the ability of enforce a unique standard where necessary to support the health of the Ohio River.

ORSANCO does its own studies revealing the uniqueness of the regions along its 981-mile course. Recently a study of total dissolved solids (conductivity), one on impact of Bromides on drinking water treatment for the drinking water utilities, and now one on mercury sources, fate and effects as coal-fired powerplants have replaced areal dispersal with water dispersal of coal-bound mercury. As we put hydroelectric plants on 6 of our lock and dams, what will be the effect of climate induced low flows, that may set of toxic cyanobacterial blooms.

ORSANCO does not regulate water flows (USACE), nor monitor climate change directly (NOAA and USACE), but it can sound the alarm and work with other agencies to amend current procedures as these affect water quality standards and set standards unique to the Ohio River. I have not agreed with all ORSANCOs decisions on the standard they have set; however they have a public and open, transparent process for us to have some impact on their decision. The Ohio River needs the special care that the power to regulate water quality on the river gives them now. Giving up that power to save a few dollars when other options exist should be explored first: more time between reviews (5-7 years), alternative funding (special fishing permit for Ohio River, tax on boat gasoline and diesel, tax on barge industry for their monitoring, integration of water quality monitoring by all agencies operating on the river, its influents and discharges may reduce costs if they approve the laboratory.

This reduction in reviews and setting water quality standards will require the states to increase or renew their monitoring of the Ohio River. Ohio, a leader in biocriteria for water, under the direction of Randall Sanders began nighttime electrofishing in the 1970s, a practice adopted then by ORSANCO. In 2000s we began monitoring the length of the Ohio River in our River Runs 2001-2007 for chemistry, chlorophyll and algal IDs, practices that ORSANCO has partially adopted. The USEPA began monitoring rivers on a random pattern, not just at convenient bridges and facilities, now adopted by ORSANCO.

Research on the river has changed monitoring to understand the longitudinal processes of the river. Presumably this will continue, but the implementation into standards will require each state to use their data and come to independent conclusions about their standard. Standards for water quality, for mixing zones or not, for appreciation of exposure routes (e.g. Hg) would require new state expenditures. Ohio has standards for Lake Erie drainages, and Ohio River drainages.

Now it will need an Ohio River specific set of standards that in currently does not have. Large rivers like the Missouri, Ohio and Mississippi need unique care to maintain big river fish (paddlefish, mooneye, goldeneye, river shiner). Large rivers are light-limited systems 95% of the time and have high particulate loads that affect chemistry differently than mid-sized rivers. Let's leave that to ORSANCO for determination through their Commission and for enforcement

should it be required. Do not accept proposal #2.

Subject: Objection to eliminating ORSANCO's pollution control standards
Date: Friday, August 10, 2018 2:19:45 PM

Do not eliminate ORSANCO's pollution control standards. The EPA consistently ranks the Ohio River as the most polluted body of water in the U.S. The states obviously are not adequately monitoring and protecting the river. If ORSANCO standards are lifted, 100 of them will become missing or weaker in Indiana due to that state's lower standards, and the situation is similar in the other Ohio River states.

Each ORSANCO standard is a scientifically derived maximum amount of a chemical the river can have and still be healthy for people and aquatic life. Do not condemn our children's well-being for the sake of industrial development.

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Pamela Roberts

Date: Friday, August 10, 2018 2:44:27 PM

I am opposed to ORSANCO abandoning its mission and leaving the Ohio River to free reign by polluters. It is vital for ORSANCO to continue to monitor and regulate this river, that over five million people depend on it for drinking water. It is already rated the most highly polluted river in the United States.

Changing ORSANCO's mission is unacceptable and will jeopardize people's health and Kentucky's valuable waterways. Act instead to protect our natural resources.

We should never go backwards on trying to keep our river water safe to enjoy! We are increasing the amount of people enjoying the downtown so do not make the river unsafe to swim & boat in. We talk about keeping our young people here well part of telling them we want them to stay is to move forward with our progress on clean river water. To keep moving our city forward & improving things in Evansville which includes our river tells them we care about our city & their future.

I hope we do not give in to the people & businesses that want to pollute our water more to save them money! No way should we become like other cities that have to give warnings to not swim in the river besides that is where our drinking water comes from!

To: PCS@orsanco.org
Subject: ORSANCO PSC Comments
Date: Saturday, August 11, 2018 5:59:23 AM

I oppose and object to the proposed changes to the Pollution Control Standards (PCS) and ask that ORSANCO retain the language passed in 2015. I have lived all of my life in the Ohio River Basin and have spent considerable effort over the decades working to protect and improve the waters of the Ohio River. While I have sometimes objected to proposed changes never before I have I felt that ORSANCO was completely abdicating its mission “to ensure protection of these uses and to preserve the waters for other legitimate purposes” if it proceeds with the adoption of the changes proposed to the PCS. It is difficult to properly and completely express my disappointment in the Commission for abandoning its mission and forsaking its authority.

These commissions had difficulty cleaning up large interstate waterways precisely because they lacked the authority granted to ORSANCO in the Compact to ensure that “pollution by sewage or industrial wastes originating within a signatory State shall not injuriously affect the various uses of the interstate waters.” ORSANCO purports that the Standards are not needed because the individual states now have NPDES programs and water quality standards that must be approved by EPA under the CWA when a number of ORSANCO standards are more stringent than state standards.

But several states in the Compact, including Kentucky, have prohibitions against standards that are more stringent than the EPA and so for a number of states, permits will be less stringent if the Commission votes to approve these changes and abdicates its responsibility to protect the river. This will certainly not result in improved water quality in the Ohio River. It will likely not even result in the status quo for water quality.

This is in no way comparable to the Commission simply stating that because state standards are approved by EPA that the river as a whole will be protected. Standards vary state by state. Currently, the PCS regulations require that states use ORSANCO standards or a state standard if it is more stringent. Therefore, the protections will not be consistent or as stringent if these changes are approved and the PCS regulations are gutted.

I continue to assert that some combination of alternative 3 and/or 4 as presented in the preliminary comment period will provide better protection for the Ohio while adhering to the Compact and the mission of the Commission. In addition, a combination of 3 and 4 would also implement the recommendations in the 1974/5 EPA study and continue ORSANCO's legacy of providing valuable leadership to the Ohio River states. Proposing a cost effective way to selectively modify the PCS after review as warranted and increase focus on harmonization of standards and their implementation among Compact states and EPA would preserve ORSANCO's leadership role in the basin.

I object to the proposed changes. If approved ORSANCO is abandoning its mission and obligation to the people of the Ohio River Basin, but even worse, the water quality and quality of life of people in the Ohio River Basin will continue to suffer.

Greetings

I have reviewed the proposed changes to the ORSANCO pollution control standards regulations, posted at: <http://www.orsanco.org/wp-content/uploads/2018/06/Draft-2018-Pollution-Control-Standards-Marked-Version.pdf>.

The proposed changes appear to completely remove all of ORSANCO's existing regulatory authority, in lieu of the inconsistent and highly variable regulations on Water Quality Standards and NPDES effluent limitations promulgated by the various states along the Ohio River.

I am not in favor of this rule change, because it would remove the primary venue for assuring consistency - and an important whole river focus - in protecting the Ohio River. By definition, states are concerned primarily with the waters within their boundaries. Waters that border one or more states are often the subject of disagreement and legal disputes when it comes to water quality protection and restoration (e.g., Oklahoma vs Arkansas, Florida vs, Georgia, etc.). ORSANCO has provided a valuable forum as an arbiter for resolving such disputes, and - more importantly - for instituting a regulatory regime where the resolution of such disputes can be effectuated.

Please consider rescinding the proposed changes, and continuing ORSANCO's role as the legal, regulatory arbiter of interstate disagreements on water quality protection for the Ohio River. Over the years ORSANCO has performed its duties in a professional, workmanlike manner, and has served the public well. Everyone has not always agreed with the outcomes of ORSANCO's rulemaking, but the alternative - piecemeal regulations that will restart interstate squabbles about who's doing what - appears to me to be a poor choice regarding the path forward.

Thanks in advance for considering these comments, and for ORSANCO's past service to the Ohio River, its bordering states, and the people of the watershed!

As our waters supplies grow increasingly imperiled, the value of clean water becomes more and more evident. Maintaining the current pollution control standards is imperative to protecting our drinking water. Clean water is also necessary for recreation and tourism. No one wants to go kayaking in an algae bloom or fishing in chemically tainted waters.

ORSANCO has in the past used 188 parameters criteria that exceed the currently inadequate US EPA standards. Please the original ORSANCO standards in place. Our lives, and the lives of all living beings, depend upon access to clean water.

Thank you.

Dear ORSANCO:

No, do not abdicate your authority over water quality in the Ohio River. You are the glue. If the mandate is given to the states, it is easy to see how chaotic and varying standards will have a negative impact on the water quality, which correlates to the quality of life of the basin residents: people will suffer.

I have been working as a volunteer water tester, with the Watershed Watch in Kentucky program. In my county alone, over two dozen sites have been improved because of our efforts. The end result is locally improved waterways, and then improvement of what is flowing into the Ohio. It is a group activity—don't leave the group!

The return of pollution controls from ORSANCO to bordering States is dangerous. As a taxpayer and voter I stand firmly against such a move. The existing mishmash of state pollution rules is a tangled web at best. Today ORSANCO is like a warden in a prison whose control serves to maintain order among inmates. For the Warden to give up all sense of order to inmates is seeking the quickest way to ensure a riotous group of inmates, in this case a return to an Ohio that is once again a sewage canal. Perhaps a better example might be a Madam in a House of Ill Repute turning the operation over to clients.

Gene Nettles
6989 State Route 125
Hickman, Ky. 42050
270-236-2317

P.S. My interest in the OHIO stems from the fact that proximity to the Mississippi River causes alarm as to what might be added to pollutants already flowing nearby.

From: [Dale Reynolds](#)
To: PCS@orsanco.org
Subject: Comments on PCS
Date: Sunday, August 12, 2018 11:51:05 AM

To: ORSANCO PSC Committee and Commisioners

ORSANCO has been given regulatory power to assist its (8) member states with monitoring and setting water quality standards for the Ohio River Basin. It has served in that capacity since 1948. Due to the existence of ORSANCO, the eight member states have been coordinated in their approaches to monitoring and regulating activities that impact the Ohio River system. Over that time, ORSANCO has promulgated numerous water quality standards to improve the health of the Ohio River basin for its citizens, some, of which, were not universally popular with all compact member states. Yet ORSANCO has continued to serve as an outside scientific advisor to the states, without members choosing to discontinue their participation.

The stated motivation for dropping the triennial review of PCS is that:

"Because all states are mandated by the federal Clean Water Act to adopt and submit for USEPA approval a program that addresses designated uses, free from mandates, wastewater discharge requirements, water quality standards, mixing zones, and more, the Commission has concluded that the requirements of the Compact are being satisfied by member state programs implementing the federal Clean Water Act. The Commission has also concluded that all of its member states are implementing programs approved under the federal Clean Water Act for the safe and satisfactory uses of the Ohio River as public and industrial water supplies after reasonable treatment, suitable for recreational usage, capable of maintaining fish and other aquatic life, and that therefore the requirement of the Compact are being satisfied by member states through these programs.

Given the fact that all member states are implementing approved programs under the federal Clean Water Act, the Commission will discontinue the triennial review process of updating the PCS rules. By proceeding under this approach the Commission is confident that public will have the full and complete protection of the federal Clean Water Act and the oversight of USEPA and the states without the redundancy of the current PCS program."

States have been implementing approved programs under the federal Clean Water Act for a number of years; it is puzzling that ORSANCO is motivated to step away from its mandate now. An act that will allow variations in regulatory standards and enforcement priorities that will vary across the watershed. While variations have always existed among state laws, the loss of ORSANCO's influence and authority will result in an erosion of the cooperation among member states on water quality in the Ohio River.

The following questions need to be answered to make sense of the current push by ORSANCO to abdicate the authority delegated to it by the US Congress and its member states:

1. How many water quality standards (including concentration variations) has ORSANCO established that did not exist under the federal Clean Water Act?
2. With state and federal budgets being cut annually, and environmental staffs dwindling, why is now a good time to discontinue this third-party oversight? Do you really feel confident that state and federal agencies can do an equivalent job with less money and fewer staff each year than they did the year before? The current political climate does not show any interest in improving, or even promoting, water quality standards.
3. What, exactly, are the redundancies that are proposed to be eliminated, and when were they created? Without changes being made since October 2015, what makes these redundancies so unbearable now?

I urge the commission to reject option 2 and embrace options 3 & 4.

Subject: ORSANCO standards on Ohio River
Date: Sunday, August 12, 2018 2:54:23 PM

To whom it may concern, *ORSANCO*,

I am an ordained Presbyterian pastor serving our national denomination on hunger, poverty, and earth care concerns. I am also a mother of two children and our family lives about a mile from the Ohio River in southern Indiana, just across from Louisville where I grew up and have enjoyed the river all my life. However, I have enjoyed the river from balconies, lawns, and boats rather than getting into the water itself because of its level of pollution. I love water and take vacations to other rivers, lakes, and even the ocean when possible, and it is ironic that I have to travel far to enjoy other places rather than the river that makes up my home geography.

I think I've missed the official comment period but still wanted to register my serious concern about your recent recommendations for state-level controls on the river. These are in no way adequate to keep our watershed clean, or to make this beloved river a better place for my own children and grandchildren than it was for me. Please work to set standards that are good for all and for the health of the river.

Thank you,
Rebecca

Subject: Opposing the Changes to the Ohio River Regulation
Date: Sunday, August 12, 2018 8:23:26 PM

I am in full opposition to the changes proposed to allow individual states to regulate the Ohio River. Please see the message below as well.

To: ORSANCO PSC Committee & Commissioners
From: Judith Petersen, [2995 Hammonsville Rd., Munfordville, KY 42765](mailto:Judith.Petersen@orsanco.org)
Date: August 6, 2018
Re: Comments on PCS

I oppose and object to the proposed changes to the Pollution Control Standards (PCS) and ask that ORSANCO retain the language passed in 2015. I have lived most of my life in the Ohio River Basin and have spent considerable effort over the decades working to protect and improve the Ohio River. I have participated in the PCS triennial review consistently since 2005. While I have sometimes objected to proposed changes never before I have I felt that ORSANCO was completely abdicating its mission “to ensure protection of these uses and to preserve the waters for other legitimate purposes” if it proceeds with the adoption of the changes proposed to the PCS. It is difficult to properly and completely express my disappointment in the Commission for abandoning its mission and forsaking its authority.

I’ve had the opportunity to work with other multi-state commissions on large rivers. These commissions had difficulty cleaning up large interstate waterways precisely because they lacked the authority granted to ORSANCO in the Compact to ensure that “pollution by sewage or industrial wastes originating within a signatory State shall not injuriously affect the various uses of the interstate waters.” ORSANCO purports that the Standards are not needed because the individual states now have NPDES programs and water quality standards that must be approved by EPA under the CWA when a number of ORSANCO standards are more stringent than state standards.

But several states in the Compact, including Kentucky, have prohibitions against standards that are more stringent than the EPA and so for a number of states, permits will be less stringent if the Commission votes to approve these changes and abdicates its responsibility to protect the river. This will certainly not result in improved water quality in the Ohio River. It will likely not even result in the status quo for water quality.

US EPA addressed the very issue at the crux of ORSANCO’s assumption in a study, titled *A Study of Prospective Water Pollution Control Activities For The Ohio River Valley Water Sanitation Commission*, was released in March 1975, and with respect to “stream standards,” recommended that:

Since the Ohio is a boundary river, and because there are many other relationships as among the several state segments of the river system, the interstate agency should provide the overall view and the comparative analyses

needed for coordination, consistency and equity.

Whereas the current PCS state: “Sections 301(b)(1)(C) and 510 of the Federal Act require that permits issued under that system incorporate applicable standards promulgated by an interstate agency wherever they are more stringent than comparable state or federal standards. And that these standards set forth the uses to be protected in the Ohio River (Chapter 2) as established in the Compact, establish water quality criteria to assure that those uses will be achieved (Chapter 3), and set wastewater discharge requirements (Chapter 5) needed to attain the water quality criteria. The standards also recognize the rights of individual states to adopt and apply more stringent regulations.

Specific wastewater discharge requirements are established in these regulations and must be incorporated into discharge permits issued under the authority of the NPDES or state discharge permitting programs when they are more stringent than:

- 1) applicable U.S. EPA technology-based effluent guidelines required under Sections 301, 304, 306, and 307 of the Federal Clean Water Act, or
- 2) any state treatment requirements, effluent standards, or water quality-based effluent limits.

In the absence of promulgated Federal effluent guidelines pursuant to Sections 301, 304, 306, and 307 of the Clean Water Act, the Compact signatory states have the responsibility to establish effluent limitations to be included in any discharge permit, consistent with the standards contained herein using best professional judgment on a case-by-case basis.”

This is in no way comparable to the Commission simply stating that because state standards are approved by EPA that the river as a whole will be protected. Standards vary state by state. Currently, the PCS regulations require that states use ORSANCO standards or a state standard if it is more stringent. Therefore, the protections will not be consistent or as stringent if these changes are approved and the PCS regulations are gutted.

I continue to assert that some combination of alternative 3 and/or 4 as presented in the preliminary comment period will provide better protection for the Ohio while adhering to the Compact and the mission of the Commission. In addition, a

combination of 3 and 4 would also implement the recommendations in the 1974/5 EPA study and continue ORSANCOs legacy of providing valuable leadership to the Ohio River states. Proposing a cost effective way to selectively modify the PCS after review as warranted and increase focus on harmonization of standards and their implementation among Compact states and EPA would preserve ORSANCOs leadership role in the basin.

I object to the proposed changes. If approved ORSANCO is abandoning its mission and obligation to the people of the Ohio River Basin, but even worse, the water quality and quality of life of people in the Ohio River Basin will continue to suffer.

Subject: PCS comments
Date: Sunday, August 12, 2018 9:24:27 PM

I oppose and object to the proposed changes to the Pollution Control Standards (PCS) and ask that ORSANCO retain the language passed in 2015. ORSANCO would completely abdicate its mission “to ensure protection of these uses and to preserve the waters for other legitimate purposes” if it proceeds with the adoption of the changes proposed to the PCS. This is clearly within ORSANCO’s authority, so I am confused as to why they would abandon their responsibility.

I ORSANCO purports that the Standards are not needed because the individual states now have NPDES programs and water quality standards that must be approved by EPA under the CWA when a number of ORSANCO standards are more stringent than state standards. In interstate waterways, the “tragedy of the commons” is ripe. The states have no incentive to consider the pollution contributed by neighboring states.

Several states in the Compact, including Kentucky, have prohibitions against standards that are more stringent than the EPA and so for a number of states, permits will be less stringent if the Commission votes to approve these changes and abdicates its responsibility to protect the river. This will certainly not result in improved water quality in the Ohio River. It will likely not even result in the status quo for water quality.

US EPA addressed the very issue at the crux of ORSANCO’s assumption in a study, titled A Study of Prospective Water Pollution Control Activities For The Ohio River Valley Water Sanitation Commission, was released in March 1975, and with respect to “stream standards,” recommended that:

Since the Ohio is a boundary river, and because there are many other relationships as among the several state segments of the river system, the interstate agency should provide the overall view and the comparative analyses needed for coordination, consistency and equity.

Whereas the current PCS state: “Sections 301(b)(1)(C) and 510 of the Federal Act require that permits issued under that system incorporate applicable standards promulgated by an interstate agency wherever they are more stringent than comparable state or federal standards. And that these standards set forth the uses to be protected in the Ohio River (Chapter 2) as established in the Compact, establish water quality criteria to assure that those uses will be achieved (Chapter 3), and set wastewater discharge requirements (Chapter 5) needed to attain the water quality criteria. The standards also recognize the rights of individual states to adopt and apply more stringent regulations.

Specific wastewater discharge requirements are established in these regulations and must be incorporated into discharge permits issued under the authority of the NPDES or state discharge permitting programs when they are more stringent than:

- 1) applicable U.S. EPA technology-based effluent guidelines required under Sections 301, 304, 306, and 307 of the Federal Clean Water Act, or
- 2) any state treatment requirements, effluent standards, or water quality-based effluent limits.

In the absence of promulgated Federal effluent guidelines pursuant to Sections 301, 304, 306, and 307 of the Clean Water Act, the Compact signatory states have the responsibility to establish effluent limitations to be included in any discharge permit, consistent with the standards contained herein using best professional judgment on a case-by-case basis.”

This is in no way comparable to the Commission simply stating that because state standards are approved by EPA that the river as a whole will be protected. Standards vary state by state. Currently, the PCS regulations require that states use ORSANCO standards or a state standard if it is more stringent. Therefore, the protections will not be consistent or as stringent if these changes are approved and the PCS regulations are gutted.

I object to the proposed changes. If approved ORSANCO is abandoning its mission and obligation to the people of the Ohio River Basin, but even worse, the water quality and quality of life of people in the Ohio River Basin will continue to suffer.

It is important that the ORSANCO Commission maintains the Oct. 8, 2015 Pollution Control Standards for Discharges into the Ohio River. I ask ORSANCO to reject the proposed changes which effectively strip the commission of the power to maintain sanitary standards and safe drinking water for the over 900 miles this river travels within and along eight states: Illinois, Indiana, Kentucky, New York, Ohio, Pennsylvania, Virginia and West Virginia.

The Ohio River has come a very long way in pollution control. Why lose years of dedicated work and continuous improvements in clean, safe drinking water? All eight states acting together saved the Ohio River from the whims of each state's regulations and standards.

Sincerely,
Nancy C. Brown

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Pollution control standard of 10/8/2015 for discharge into the Ohio River must be kept in place. My main concern is that removing ORANSCO standards severely weakens regulatory protections for water quality on the Ohio River. Each state would be left to regulate the river on its own, creating conflicts if an upstream states standards were not as strong as a downstream state. Further the power industry would have a much easier time imposing their will on individual states rather than dealing with a multistate compact organization. This is not a vote for the future of the river and all the people and animals that use it. Please stand firm on these existing standards.

Date: Monday, August 13, 2018 11:23:52 AM

Hello,

I'm writing to respectfully express my strong opposition to the elimination of ORSANCO's pollution control standards for the Ohio River.

Standards enacted by all of the states along the Ohio River will not adequately protect the river; there are more than 100 ORSANCO standards that are either missing or weaker than standards in my home state, Indiana, and I understand that the situation is similar in the other Ohio River states.

ORSANCO has a critical role in protecting the quality of water in the Ohio River, which is already one of the most polluted rivers in the United States. Please do not give in to pressure from polluters -- help us keep improving Ohio River water quality by opposing the elimination of numeric pollution limits and public input!

Sincerely,

Rachel Guglielmo
Bloomington, IN

From: joanne.gerson@earthlink.net
To: pcs@orsanco.org
Subject: Please support alternatives numbers 3 and 4 for continued authority to protect our Ohio Rivers water quality.
Date: Monday, August 13, 2018 11:53:13 AM

Dear Honorable ORSANCO Commissioners:

Numerous studies confirm that **the Ohio River is the most polluted river** in the United States.

There are new threats coming to Ohio River. The Appalachia Storage and Trading Hub is a **\$10+ billion infrastructure project** between China Energy (formerly Shenhau) and West Virginia University that will expand the market for ethane and other natural gas liquids (NGLs) production from the liquids-rich Ohio and West Virginia Marcellus and Utica Shale Formations. The project consists of a network of pipeline infrastructure that provides connectivity between NGL storage capacity, cracker plants, and manufacturing facilities in Ohio and West Virginia. https://energy.wvu.edu/files/d/828c68de-e0c3-4d05-91ca-a1e9b4914fbc/faq_china-energy.pdf

Between 1980 and 2005, the oil and gas industry lobbyists succeeded in obtaining **exemptions for the fracking industry from EPA regulations**, including the following: 1. Safe Drinking Water Act, 2. Clean Water Act, 3. Clean Air Act, 4. Toxic Release Inventory of EPCRA, 5. National Environmental Policy Act – NEPA, 6. Resource Conservation and Recovery Act – RCRA and 7. Comprehensive Environmental Response, and the Comprehensive Environmental Response, Compensation, and Liability Act – CERCLA. Each state has their own set of exemptions for the oil and gas production industry. https://earthworks.org/publications/loopholes_for_polluters/

In addition, **Mercury pollution**, a potent neurotoxin that impairs fetal brain development, in the Ohio River **increased by more than 40%** between 2007 and 2013, according to EPA data. High levels of nitrates and other pollutants also plague the river. Additionally, coal plants, factories, and water treatment facilities dot the riverbanks, discharging byproducts that contribute to pollution and health hazards in the river. <http://elpc.org/issues/clean-water/ohio-river/>

Ohio and Indiana have **no authority** to stop polluters upstream, a result of the 1788 the Continental Congress Northwest Ordinance, giving the Commonwealth of Virginia and its later derivative states full control of the Ohio River, up to the north bank.

Only ORSANCO has the power to protect the Ohio River for Ohio and Indiana from pollution from new projects and other industrial polluters.

Please support alternatives #s 3 and 4 for continued authority to protect our Ohio River water quality.

Thank you for your serious consideration.

ORSANCO:

Please do not abandon your role in setting pollution control standards for the Ohio River. Your organization has been vital in ensuring the health of all people, businesses and other entities who depend upon the river for clean drinking water, bathing water - and water used for production purposes.

What has possibly changed enough to allow this commission even to think about abandoning the role you have played for six decades in ensuring water quality in the Ohio River basin?

There is no other entity - including the EPA - which can or will provide the care, knowledge and expertise needed for setting proper standards for the unique water system which is the Ohio River.

People are tremendously aware of ORSANCO and this pending decision.

Be assured that citizens do not want any lower water quality standards and they do not want ORSANCO to abandon the mission it was given in 1948.

Subject: Ohio River Water
Date: Monday, August 13, 2018 1:03:16 PM

To Whom It May Concern:

I am submitting my concerns and incredulousness to the change of water quality in the Ohio River Water to include any and all sources of water including the river itself, the streams, and other conveyances that are feeders to the river, whether natural or manmade. I am in strong disagreement to the diminution of any regulations that would impact the water quality as it relates to those standards set before 2016 and is now being discussed as regulation that will significantly impact the water quality of the river and its tributaries.

This includes my vociferous contempt for any and all changes that will allow water quality changes that emanate from business, industry, and the public from sewage, waste water, and all and any solid or liquid that can be entered into the river under the revised and proposed rules.

Any relaxation of the rules set previous to 2016 must not be permitted or allowed. Such change must be strengthened not diminished in any way that will impact the water quality and thus the biological, chemical and physical aspects of the Ohio River and its tributaries. Any attempt to change the regulations that decreases those values and rules to protect the water and ultimately the land, any change that would ultimately impact how downstream communities will be impacted in their use of the Ohio River for drinking water will be costly both in the sense of human health and community costs for treating water for public use.

I strongly urge any changes made to decrease water quality standards be declined and rejected.

Subject: I value the water pollution control standards set by ORSANCO
Date: Monday, August 13, 2018 2:08:28 PM

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). If ORSANCO no longer sets water quality standards, then each state would be left to decide how clean the river should be. Please do not allow ORSANCO to abdicate its responsibility to protect the drinking water, recreational opportunities, and tourist revenue that the Ohio River brings to our great state.

ORSANCO has a unique and settled opportunity to protect and improve water quality in the Ohio River Basin, in part by setting these standards for the maximum levels of various pollutants in the river. The standards are not an unnecessary regulatory burden, but rather provide certainty for regulated entities along the length of the Ohio River while providing protection of designated uses. According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the EPA lack. At a time when the federal government is eliminating or weakening environmental and public health safeguards, it is even more urgent that ORSANCO's pollution control standards remain in place.

I and other Kentucky citizens are grateful for ORSANCO's role in protecting the Ohio River. Stripping ORSANCO of its authority would weaken public confidence in this important Commission. And I am not alone asking for the current pollution control standards be maintained; drinking water authorities and utilities agree. They also understand the need for ORSANCO to set the standard for the entire Ohio River to protect the drinking water of 5 million people. Please do not take away ORSANCO's unique authority to protect the Ohio River.

Thank you,

Ashley Wilmes

Subject: Keep ORSANCO standards for the Ohio River
Date: Monday, August 13, 2018 2:12:57 PM

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). If ORSANCO no longer sets water quality standards, then each state would be left to decide how clean the river should be. Please do not allow ORSANCO to abdicate its responsibility to protect the drinking water, recreational opportunities, and tourist revenue that the Ohio River brings to our great state.

I am alarmed at the prospect of river quality standards being left to a variety of state standards rather than a uniform standard. The water quality of the river is too important to all the citizens and companies that depend on the river for water usage to be left to individual state standards that too often slip lower in response to polluter pressure for economic profit motives. Clean water is becoming harder to obtain in the world and we often take it for granted, but NOTHING is more important than sufficient clean water.

ORSANCO has a unique and settled opportunity to protect and improve water quality in the Ohio River Basin, in part by setting these standards for the maximum levels of various pollutants in the river. The standards are not an unnecessary regulatory burden, but rather provide certainty for regulated entities along the length of the Ohio River while providing protection of designated uses. According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the EPA lack. At a time when the federal government is eliminating or weakening environmental and public health safeguards, it is even more urgent that ORSANCO's pollution control standards remain in place.

I and other Kentucky citizens are grateful for ORSANCO's role in protecting the Ohio River. Stripping ORSANCO of its authority would weaken public confidence in this important Commission. And I am not alone asking for the current pollution control standards be maintained; drinking water authorities and utilities agree. They also understand the need for ORSANCO to set the standard for the entire Ohio River to protect the drinking water of 5 million people. Please do not take away ORSANCO's unique authority to protect the Ohio River.

Thank you for your attention to my comments. I and my family are dependent on water from the Ohio River.

Hello,

I am writing in response to the potential loss of the Ohio River Regional Water Standards. I understand that the Ohio River will lose its regional protection and it will be up to each state to set individual limits. I please ask that you keep the authority to set standards and keep them the same for all the states.

Thank you,
Ariel

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

I live on the Ohio river at Louisville and rely on clean water to drink. I also kayak along the length of the river and it's feeder streams. If clean water standards are abandoned, local economies will lose income from tourist dollars spent by kayakers and others who enjoy clean waterways and the communities along them. Your decision will not only impact water quality, it will also impact the economic health of the communities along the Ohio River and it's feeder streams.

PLEASE do not abandon your responsibility to maintain clean water.

Dear To Whom It May Concern,

Please don't pull out of setting and enforcing water quality standards. If left up to the bordering states, it will: 1.) Probably not happen due to lack of experience and funding, 2.) Creating new state agencies at an increased cost to taxpayers to enforce those new state standards, 3.) This gives more power to the state and federal E.P.A., which doesn't seem to have quite the track record in enforcing environmental concerns, such as, in past administrations. Bottom line, if you abandon the waterways everyone will lose, especially the communities and people who live along those waterways!

Sincerely,

Fred Orend

I object to the proposed changes to regulation of the Ohio River. Individual states have proven time and time again that they are unreliable regulators and will serve economic interests over public health every time.

From: [Carl Vogel](#)
To: PCS@orsanco.org
Subject: ORSANCO abdication of responsibilities
Date: Tuesday, August 14, 2018 10:51:34 AM

The change from enforcing Ohio River Environmental standards to reverting to State control is a really bad idea. Kentucky, for example, does not enforce any water quality standards above EPA limits. As the EPA is under attack by the present administration, those controls are weakened. The States forming the Ohio River watershed must continue to protect the Ohio River from further degradation, and actively work to continue to clean up this vital resource. Backing away from this task is a serious blow to the possibility of environmental health. We have fish not fit to eat, a river serving as an industrial dump (though couched in much nicer language, of “permitted discharge”) and a growing water crisis of the future.

Do not abandon ORSANCO’s role as River keeper.

Subject: Ohio River Pollution Control Standards Review

Dear ORSANCO:

I am writing in opposition to the proposed relaxation or reduction of Ohio River pollution control and discharge standards by ORSANCO. I research and teach about water resources and resilience. As unprecedented disasters and shocks affect communities throughout the U.S., improving the resilience and reducing the vulnerabilities of our communities has become a very high public-policy priority for everyone. Examples like Flint, MI, New Orleans, LA, and Puerto Rico illustrate how disaster becomes catastrophe when institutional safeguards and regulations are reduced or ignored in the name of economic or administrative efficiency. The drinking water supplies of communities throughout the Ohio River Valley are vulnerable to pollution in the Ohio River. Those portions of Ohio River Valley communities that are low-income, fixed-income, disabled, rural, or substantially composed of racial or ethnic minorities are especially vulnerable, which is an issue not only of environmental injustice but also of resilience injustice. ORSANCO's Ohio River pollution control and discharge standards play critically important roles in improving overall systemic resilience in the Ohio River Basin and decreasing the vulnerabilities of all communities throughout the region. ORSCANCO's standards address basin-specific needs and contexts in the Ohio River Basin that are not adequately addressed by national standards under the Clean Water Act, which have been adopted for application nationally to many different watersheds and waterways (including communities that rely less heavily on a river for drinking water supplies). At a very minimum, any proposed modifications to existing regulations should undergo a systematic resilience/vulnerability assessment, including a resilience justice assessment, that identifies and discusses the impacts of any regulatory modifications on the resilience and vulnerabilities of Ohio River Valley communities, their drinking water supplies, and their people. Any changes that would decrease resilience and increase vulnerability should be rejected or revised. Thank you for your kind consideration of my comments, which I submit solely in my personal capacity as a concerned citizen. Sincerely, Craig Anthony (Tony) Arnold, 3105 Dunlieth Ct., Louisville, KY 40241

From: [Rachel McGuire](#)
To: PCS@orsanco.org
Subject: Pollution Control Standards for the Ohio River
Date: Tuesday, August 14, 2018 3:06:49 PM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Mike Bigelow

Subject: Let's keep ORSANCO standards for the Ohio
Date: Tuesday, August 14, 2018 6:23:38 PM

Dear Sirs,

I write today to urge the Commission to reject a recent proposal to abandon our current regional water standards for the Ohio River.

According to the Ohio River Foundation, fully 10 percent of Americans live in the Ohio River Basin. The river is the source of drinking water for over 3,000,000 people.

Even with the more stringent standards currently in place, our water quality is imperiled. 26 coal-burning plants are situated along the Ohio's banks, about one every 38 miles. Perhaps it's not surprising that the Environmental Working Group rates the Ohio as the third most polluted river in the country.

The evidence is clear that the people who rely on the Ohio for safe, clean drinking water are in need of the stronger standards that are currently in place. Abandoning these standards is simply too risky for the health of the region.

Sincerely,
Jason Cooper
Lexington, KY

Re: Comments on PCS

I oppose and object to the proposed changes to the Pollution Control Standards (PCS), and ask that ORSANCO retain the language passed in 2015. I have lived the past 12 years in the Ohio River Basin and have been involved in a number of efforts to protect and improve the Ohio and Missouri Rivers. While I have sometimes objected to proposed changes previously from ORSANCO, never before I have I felt that ORSANCO was proposing to

COMPLETELY ABDICATE ITS MISSION

“to ensure protection of these uses and to preserve the waters for other legitimate purposes.” If it proceeds with the adoption of the changes proposed to the PCS, it will be difficult to fully express my horror and my disappointment in the Commission for forsaking its authority and abandoning its mission.

ORSANCO purports that the Standards are not needed because the individual states now have NPDES programs and water quality standards that must be approved by EPA under the CWA when a number of ORSANCO standards are more stringent than state standards.

But several states in the underlying Compact, including Kentucky, have prohibitions against standards that are more stringent than the EPA and so for a number of states, permits will be less stringent if the Commission votes to approve these changes and abdicates its responsibility to protect the river. This will certainly not result in improved water quality in the Ohio River. It will likely make the water quality degrade.

US EPA addressed the very issue at the crux of ORSANCO's assumption in a study released in March 1975, titled *A Study of Prospective Water Pollution Control Activities For The Ohio River Valley Water Sanitation Commission*. With respect to “stream standards,” this study recommended that:

Since the Ohio is a boundary river, and because there are many other relationships as among the several state segments of the river system, the interstate agency should provide the overall view and the comparative analyses needed for coordination, consistency and equity.

Whereas the current PCS state: “Sections 301(b)(1)(C) and 510 of the Federal Act require that permits issued under that system incorporate applicable standards promulgated by an interstate agency wherever they are more stringent than comparable state or federal

standards. And that these standards set forth the uses to be protected in the Ohio River (Chapter 2) as established in the Compact, establish water quality criteria to assure that those uses will be achieved (Chapter 3), and set wastewater discharge requirements (Chapter 5) needed to attain the water quality criteria. The standards also recognize the rights of individual states to adopt and apply more stringent regulations.

Specific wastewater discharge requirements are established in these regulations and must be incorporated into discharge permits issued under the authority of the NPDES or state discharge permitting programs when they are more stringent than:

- 1) applicable U.S. EPA technology-based effluent guidelines required under Sections 301, 304, 306, and 307 of the Federal Clean Water Act, or
- 2) any state treatment requirements, effluent standards, or water quality-based effluent limits.

In the absence of promulgated Federal effluent guidelines pursuant to Sections 301, 304, 306, and 307 of the Clean Water Act, the Compact signatory states have the responsibility to establish effluent limitations to be included in any discharge permit, consistent with the standards contained herein using best professional judgment on a case-by-case basis.”

This existing language is in no way comparable to the Commission declaring that because state standards are approved by EPA that the river as a whole will be protected. Standards vary state by state. Currently, the PCS regulations require that states use ORSANCO standards or a state standard if it is more stringent. Clearly, the protections will not be consistent or as stringent if these changes are approved and the PCS regulations are gutted.

I submit that some combination of alternative 3 and/or 4 as presented in the preliminary comment period will provide better protection for the Ohio than the proposed abdication choice, while adhering to the Compact and the mission of the Commission. In addition, a combination of 3 and 4 could also implement the recommendations in the 1974/5 EPA study, provide thoughtful harmonization of the PCS standards and their implementation among Compact states, and continue ORSANCO’s valuable legacy of providing leadership to the Ohio River states.

So again, I object to the proposed changes. If they are approved, ORSANCO is abandoning its mission and obligation to the people of the Ohio River Basin. Even worse, the water quality, and the quality of life of people in the Ohio River Basin will be degraded, and they will suffer.

DON'T DO IT!

Don't abandon the mission of orsanco and leave the Ohio River to the polluters.

From: [Barbara Klinger](#)
To: PCS@orsanco.org
Subject: Pollution Control Standards for the Ohio River
Date: Tuesday, August 14, 2018 10:03:21 PM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Friends,

I object to the proposal to drop ORSANCO water quality standards and transfer responsibility to the states.

My own state of Kentucky might be able to come up with standards, but I have no confidence whatsoever that they would be anywhere as strict as those from ORSANCO. Plus, I'm not sure they would assign any manpower to enforcement.

All in all, it's a bad idea to ask states to take over this responsibility.

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). If ORSANCO no longer sets water quality standards, then each state would be left to decide how clean the river should be. Please do not allow ORSANCO to abdicate its responsibility to protect the drinking water, recreational opportunities, and tourist revenue that the Ohio River brings to our great state.

ORSANCO has a unique and settled opportunity to protect and improve water quality in the Ohio River Basin, in part by setting these standards for the maximum levels of various pollutants in the river. The standards are not an unnecessary regulatory burden, but rather provide certainty for regulated entities along the length of the Ohio River while providing protection of designated uses. According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the EPA lack. At a time when the federal government is eliminating or weakening environmental and public health safeguards, it is even more urgent that ORSANCO's pollution control standards remain in place.

I and other Kentucky citizens are grateful for ORSANCO's role in protecting the Ohio River. Stripping ORSANCO of its authority would weaken public confidence in this important Commission. And I am not alone asking for the current pollution control standards be maintained; drinking water authorities and utilities agree. They also understand the need for ORSANCO to set the standard for the entire Ohio River to protect the drinking water of 5 million people. Please do not take away ORSANCO's unique authority to protect the Ohio River.

I live in Louisville and drink water from the Ohio River every day as do thousands of Kentuckians. Please do not stop protecting our water.

Subject: Pollution Control Standards for the Ohio River
Date: Wednesday, August 15, 2018 11:10:10 AM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Subject: ORSANCO Proposed Changes to the Pollution Control Standards ("PCS")
Date: Wednesday, August 15, 2018 12:05:33 PM

Ladies and Gentlemen:

My wife and I have lived on the Ohio River for twenty-one years, and prior to moving our home to the River enjoyed recreational boating in the Louisville area since 1975. During that time we have seen a marked change for the better in water quality, notwithstanding continued increased utilization of this wonderful resource for both recreational and industrial use. Whether we are on our dock with friends and family or boating the increased number of fish, ducks and geese, and other wildlife is apparent. The probabilities are great that left completely to residents of the states bordering the river and the states themselves this improvement would not have occurred.

I oppose in the strongest possible terms the proposed changes to the PCS, strongly urge ORSANCO to retain the language passed in 2015 and to continue to require states to utilize ORSANCO standards, or state standards if those standards are more strict than the ORSANCO standards.

Please do not abandon and neglect your stated mission and your obligation owed to the residents of the Ohio River Basin to maintain the water quality and the resulting quality of life of people such as the undersigned and our friends and family who work and live there.

Most sincerely,

Joseph R. Gathright, Jr.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Subject: Opposition to removing Ohio River water protections - From Tim Moorhead
Date: Wednesday, August 15, 2018 12:38:35 PM

Greetings, I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). If ORSANCO no longer sets water quality standards, then each state would be left to decide how clean the river should be. Please do not allow ORSANCO to abdicate its responsibility to protect the drinking water, recreational opportunities, and tourist revenue that the Ohio River brings to our great state.

ORSANCO has a unique and settled opportunity to protect and improve water quality in the Ohio River Basin, in part by setting these standards for the maximum levels of various pollutants in the river. The standards are not an unnecessary regulatory burden, but rather provide certainty for regulated entities along the length of the Ohio River while providing protection of designated uses. According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the EPA lack. At a time when the federal government is eliminating or weakening environmental and public health safeguards, it is even more urgent that ORSANCO's pollution control standards remain in place.

I and other Kentucky citizens are grateful for ORSANCO's role in protecting the Ohio River. Stripping ORSANCO of its authority would weaken public confidence in this important Commission. And I am not alone asking for the current pollution control standards be maintained; drinking water authorities and utilities agree. They also understand the need for ORSANCO to set the standard for the entire Ohio River to protect the drinking water of 5 million people. Please do not take away ORSANCO's unique authority to protect the Ohio River.

Thank you!

Sincerely,

Tim Moorhead

This email is to provide my comments in opposition to the selection of Alternative #2 by the ORSANCO board.

The proposed revisions under Alternative #2 simply remove all enforcement by ORSANCO of the water quality in the Ohio River. This is unacceptable.

Any arguments relying on the EPA and state regulators to maintain sufficient regulations are poor. The EPA is not intended to have a narrow focus that is crucial to regional interests. As an example, the EPA has failed in its oversight of state drinking water programs resulting in the disaster in Flint - <https://www.washingtonpost.com/news/to-your-health/wp/2018/07/19/after-flint-debacle-epa-must-strengthen-oversight-of-state-drinking-water-programs-watchdog-says/>.

Further, with regards to the Ohio River, having multiple states set their own regulations has the possibility of creating a race to the bottom in order to court industry.

ORSANCO is needed to set uniform standards that is focused on this important water source. And they have done this for decades. There is no reason to abandon that responsibility now. The only available rationale for why this is happening is that it seems industry has overtaken the ORSANCO board and is using it to accomplish it's interests, not the interests of the people who rely on the Ohio River for drinking water.

Please do not accept Alternative #2 and do not abdicate your responsibility of protecting the Ohio River.

Sincerely,
Justin Levy

I am a resident of Louisville, KY. I believe water quality on the Ohio would get less attention from dividing responsibilities for its regulation were relegated to the individual basin states. Kentucky of course possesses a major portion of this vital river. States on tributaries, or on only short stretches of the Ohio, might not feel the same degree of commitment to the condition of the Ohio. Please note that I oppose this proposal.

Governor Holcomb,

Earlier this week I attended the Water Summit at the JWMarriott with speakers from several states. Of course water was the main topic of discussion.

The pollution of the Ohio River was alluded to as a concern. My cousin raced boats for Mercury off the Indiana shore in the 1960's. It was an exciting trip from Cass County to watch him win. An invitation by Scott County 4-H Junior Leaders provided exposure for rural Fountain County teens to experience a river boat ride. Beautiful and healthy water made the trips memorable.

Is it true that pollution standards will actually be reduced or eliminated if the Ohio River Valley Sanitation Commission is dissolved? If it remains in control of all 8 states' standards, the river should provide adequate healthy water to drink and to use for recreation. If this river is not respected, those downstream will suffer even greater discomfort. We Hoosiers need to set the standard, and, by retaining this commission, other states can be encouraged to do the same.

Should Indiana respect the needs of other states as we expect them to respect our needs and wants? Of course.

Treat others as you want to be treated....

Dear Commission,

Please do not abandon your pollution control standards. Standards imposed by states along the river do not have the same quality, in fact many states standards don't even address some of the chemicals and other factors addressed by your standards.

Clean water is something we should strive for. We aren't there yet and need to keep working to keep it cleaner and not allow backsliding. The less pollution in our Rivers the better. The standards ORSANCO set were set so that the Ohio would remain healthy for people and aquatic life. Removing or changing those standards is a move in the wrong direction.

Thank you,

ORSANCO ORSANCO via Email

Dear ORSANCO via Email,

As a constituent, I'm writing to express my concerns regarding the proposed changes to the Pollution Control Standards for discharges into the Ohio River.

ORSANCO's proposal to eliminate pollution control standards and withdraw from the process of maintaining and updating the standards moving forward is not acceptable. This approach jeopardizes the ongoing clean up and restoration of the Ohio River and is counter to the original 1948 compact that outlined the importance of watershed-wide cooperation through a joint or common agency.

The Ohio River is at a critical juncture, again topping the list of most polluted rivers in the country. In the case of the Ohio River Basin it is beneficial-- and increasingly critical-- to advance a shared conservation agenda. Because strategies and decisions must be made across numerous states and across multiple levels of government, restoration and protection of the health and living resources of the Ohio River Basin clearly begs a collaborative approach.

The Commission should continue to uphold its responsibility to protect our waterways, communities, and wildlife and to ensure all states work towards common goals and a cleaner Ohio River.

Sincerely,

Ms. Jane Kirchner

Subject: Pollution Control Standards for the Ohio River
Date: Wednesday, August 15, 2018 5:39:32 PM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Please consider this my comment:

As a concerned citizen, and someone very concerned about our waterways, water quality, and the future of water resources, I'm writing to you with opposition to proposed changes that Orsanco is considering. This multi-state commission was formed in 1948 to reduce pollution in the Ohio River. ORSANCO is proposing to eliminate its pollution control standards. They argue that the states along the Ohio R. have standards that will adequately protect the river, but that isn't accurate. There are more than 100 ORSANCO standards that are either missing or weaker in Indiana's standards, and the situation is similar in the other Ohio River states. Each ORSANCO standard is a scientifically derived maximum amount of a chemical the river can have and still be healthy for people and aquatic life.

I'm urging you maintain the pollution control protections for our Ohio river border. We are water, and every drop of water is connected.

We must
protect it all, to protect our future.

Sincerely,

Marilee Burnside

Subject: Ohio River Pollution Control Standards
Date: Wednesday, August 15, 2018 10:16:31 PM

Dear ORSANCO Commissioners,

I care deeply about water quality, especially in the river that flows so close to my home in Marietta, Ohio. In 2015, the EPA called the Ohio River one of the most contaminated bodies of water in the United States. We need tougher pollution control standards, not less regulation. Not just for bacteria, but for all sorts of industrial, agricultural, commercial, residential, and non-point sources.

Rigorous water quality standards lead to improved the water quality of the river and provide critical guidance to the states with in the basin. It is your responsibility to set uniform and tough pollution control standards for the Ohio River. I urge you to do so—for the benefit of humans and wildlife.

Please consider the following comments as you determine ORSANCO's future role.

1. States along the Ohio River are inconsistent in their water quality protections. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states. We need the uniform standards ORSANCO oversight provides.
2. States depend on ORSANCO to establish numeric criteria for toxins such as copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states. Water quality is an inter-state issue, and your job as an ORSANCO commissioner is to protect water quality the entire length of the river.
4. Weakening standards is a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

I live in Ohio, but I care about those who live downstream, from the industries that are south of me. I cared deeply about the contamination that rendered drinking water unsafe for my neighbors in West Virginia a few years ago. That must never happen again.

Why is it controversial to protect water quality? We need the highest standards for clean water.

Thank you for this opportunity to comment.

Sincerely,

Dawn Hewitt

Dear ORSANCO Commissioners,

As a voter who is informed and concerned about environmental and health issues, I understand how important it is that since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your solemn responsibility to the Americans who live in your region and their health to set uniform pollution control standards for the Ohio River. Please have the ethics and the courage to protect the children of your region from the lasting damage to their health that pollution inflicts.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins such as copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. Dear ORSANCO Commissioners,

I realize that the below is a form letter, but it makes the relevant points regarding the proposed discontinuation of ORSANCO setting water quality standards for the Ohio River. Despite the Ohio's repeated status as the most polluted river in the country, it is used for not only commerce, but for recreation and as a drinking water supply for thousands of people.

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.

Dear ORSANCO Commissioners,

Please stay committed to your responsibility to set uniform pollution control standards for the Ohio River. Since 1948, these standards have helped improve the water quality of the river and have provided critical guidance to the eight states within the basin.

Without your oversight:

1. There will be protection gaps and inconsistencies.

A 2015 comparison of state water quality standards to ORSANCO's pollution control standards found that 440 pollutants with no state quality standards or standards weaker than ORSANCO's.

2. States will have added burdens.

States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites.

3. A state-by-state approach to setting water quality standards may result in interstate conflict -- as downstream states suffer the effects of weaker upriver standards.

4. A fragmented approach sets up obstacles to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

For 70 years ORSANCO has worked to reduce pollution in the Ohio River. Please don't forsake all the time and effort that has been put into that very worthy project. I beg you to **oppose eliminating pollution control standards** set by this organization over the years. I remember a time when the Ohio River was not as clean as it is today. Eliminating pollution control standards will see us right back to those sad days.

We are grateful for ORSANCO's role in protecting the Ohio River. Stripping ORSANCO of its authority would weaken public confidence in this important Commission. And we are not alone asking for the current pollution control standards be maintained; drinking water authorities and utilities agree. They also understand the need for ORSANCO to set the standard for the entire Ohio River to protect the drinking water of 5 million people. Please do not take away ORSANCO's unique authority to protect the Ohio River.
