

July 10, 2018

ORSANCO
Attn: PCS Comments
5735 Kellogg Avenue
Cincinnati, OH 45230

To the Ohio River Valley Water Sanitation Commission (ORSANCO):

We strongly urge you to retain your authority to set pollution-control standards (PCS) for Ohio River. **Please maintain the October 8, 2015 Pollution Control Standards for Discharges to the Ohio River.** We ask you to reject the proposed changes which effectively strip the ORSANCO commission of the power to maintain sanitary standards and safe drinking water for the over 900 miles this river travels within and along eight states.

A review of the marked up proposed PCS shows the elimination of virtually all pollution-control standards. We are members of the public and are not at all confused by the effort to roll back important safeguards. Though it is claimed that other oversight entities such as the Environmental Protection Agency (EPA) can provide the guidance for pollution-control, these agencies may not necessarily have the clean-water interest at heart. Recently even the EPA has delayed new Clean Water Act rules on toxic wastewater discharges from power plants. Moreover, leaving clean water to the vagaries of state regulatory bodies and to the undue influence of energy, utility and industry will result in more dumping by industries who do not care for the environment.

The Ohio River has come a very long way in pollution control. Why lose years of dedicated work and continuous improvements in clean, safe drinking water? Industries are called to be corporate citizens, to acknowledge that the air, the water and the earth are not free resources to be ruined and depleted leaving nothing for future generations.

Please hear us in our concern for the environment. It is God's good gift, to be sustained and respected. *"Then God said, 'Let the water under the sky be gathered into a single basin, so that the dry land may appear.' And so it happened: the water under the sky was gathered into its basin, and the dry land appeared. God called the dry land 'the earth' and the basin of water he called 'the sea.' God saw how good it was." (Genesis 1:9-10)*

I am writing on behalf of the West Virginia Municipal Water Quality Association (WVMWQA) related to the Commission's second public review of its current Pollution Control Standards (PCS). The WVMWQA strongly advocates for the Commission to adopt its latest proposed amendments to the PCS, which eliminate Chapters 3 and 4, and portions of Chapter 5.

The WVMWQA is an association of local governments and wastewater authorities that support clean water, vibrant communities, and a strong state economy by seeking to align clean water goals, smart management practices, affordable technology and public infrastructure. Several of our Members discharge into the Ohio River and are therefore directly impacted by ORSANCO's efforts in the Ohio River Basin.

ORSANCO has done very good work over the years to elevate public understanding of Ohio River issues and to facilitate improvements to Ohio River water quality. That said, we agree that ORSANCO's limited resources are better off focused on river-related study, education, and water quality improvement projects than resource and time-consuming duplicative water quality standards and related rulemakings. Accordingly, the WVMWQA encourages ORSANCO to eliminate from the PCS both the water quality standards/criteria and mixing zone/wastewater discharge requirements, as set forth in the latest PCS revision, published on June 26, 2018.

We support the proposed revision for several important reasons:

GENERAL COUNSEL

Paul Calamita, AQUALAW

First, the PCS are redundant and unnecessary to protect the River given the maturity of the federal Clean Water Act (CWA) and National Pollutant Discharge Elimination System (NPDES) Program along with delegated state programs. The CWA requirement that States implement appropriate programs to satisfy CWA requirements (or that EPA step in to do so) ensures more than adequate protection

of the Ohio River and rivers nationwide. State delegated programs are comprehensive in both scope and detail. These programs are developed and implemented through notice-and-comment rulemaking as well as notice-and-comment NPDES permitting. Accordingly, water quality is adequately protected without ORSANCO's parallel PCSs.

Second, the existing framework ensures transparency to the public, from water quality standards development and implementation to NPDES permitting.

Third, because federal law requires that upstream discharges comply with downstream state requirements and EPA stands ready to address any interstate disputes, ORSANCO oversight on the basis of interstate coordination is unnecessary.

Fourth, section 510 of the CWA allows states to be more stringent than federal requirements so the withdrawal of these ORSANCO PCS will not interfere with any compact State's ability to retain any more stringent requirements in the PCS.

Fifth, we note that following and participating in ORSANCO rulemakings to update the PCS is a significant burden on citizens' and affected dischargers' time and resources, as these rulemakings are in addition to the State rulemakings to implement CWA requirements. This is compounded for those in distant states like West Virginia.

Sixth, ORSANCO's PCS can cause confusion because they are not always consistent with other State and federal requirements. This results in more work for compact states in keeping track of and implementing these differences.

Finally, many ORSANCO decisions have been between equally valid/lawful options and ORSANCO's preferred policy should not trump the delegated states' primacy in making those decisions for their states.

For these reasons, the WVMWQA strongly supports ORSANCO's proposal to eliminate from the PCS both the water quality criteria and mixing zone/wastewater discharge requirements.

Thank you for the opportunity to provide our thoughts on the best use of ORSANCO's expertise and resources.

Sincerely,

F. Paul Calamita,
General Counsel

Ohio Valley Environmental Coalition ORSANCO comments

As a nearly life-long resident of the Ohio River Valley, I appreciate these facts: Since the late 1940s, the Ohio River Valley Sanitation Commission (ORSANCO) has set baseline pollution control standards (PCS) for discharges into the Ohio River, assisted our local source water providers in monitoring the River, especially during times of known spills, and published a wealth of information about the river and its 160 species of inhabitants.

and
schedule
additional
hearings
in the
Upper &
Lower
parts of
the
Basin

Some of these standards go beyond what U.S. EPA and state regulatory agencies require. Some of the information published is essential to the operation of other public agencies, such as our state Department of Natural Resources, which regularly shares ORSANCO's fish consumption advisories on their website.

Here's a critical question for all of the ORSANCO Commissioners: Can we afford to lose these important standards and this great source of coordinated information about the entire Ohio River watershed? I am concerned that we possibly might, due to the recent decision made by the ORSANCO commissioners, to adopt "option 2" re: future pollution control standards setting and review processes.

Please reject this option (#2) and
reconsider options 3 & 4.

I strongly disagree that state-level pollution control standards are adequate, and many questions arise from this proposed change, as follows:

1. Our WV Department of Environmental Protection enforcement office is chronically understaffed. This fact was acknowledged by DEP leaders at a recent meeting with WV citizens who voluntarily monitor streams in the path of the three major pipelines currently in construction phases: the Mountaineer XPress, the Atlantic Coast Pipeline, and the Mountain Valley Pipeline. If DEP inspectors are finding themselves stretched to maximum capacity with the current pipeline monitoring, how are they going to add monitoring of potential pollution violations along the course of the Ohio River?
2. Several states rely on ORSANCO's uniform standards—set by representatives from all member states in the Ohio River watershed—and adopt them as their own. If ORSANCO no longer sets these standards, those states will have to expend the financial resources to develop standards. Will any of the states coordinate these same standards with their close neighbors, and try to ensure they are uniform along the course of the entire watershed? Why give up a system we know works for the good of all?
3. If all Ohio River states have to develop their own standards, then the situation can lead to interstate conflicts when an upriver state has weaker standards that lead to increased pollution treatment costs for a downriver state. This will likely lead to **litigation** among the states, and problems with communication and enforcement of pollution standards. How will these potential litigations stress already very tight state budgets?

info@ohvec.org

4. ORSANCO has yet to place a high priority on evaluating the effects of waste products and leaks from the unconventional oil and gas drilling industry; yet, these are causing more harmful pollutants to enter the watershed, and this will get worse if the proposed Appalachian Storage Hub gets built. Who will be responsible for monitoring and dealing with any leakage from this proposed mega-infrastructure project, which will span at least three different Ohio River bordering states?
5. It seems that this kind of cross-state monitoring role is part of the mission of ORSANCO, as stated on your website: "Since 1948, ORSANCO and its member states have cooperated to improve water quality in the Ohio River Basin, ensuring the river can be used for drinking, industrial supplies, and recreational purposes; and can support a healthy and diverse aquatic community. ORSANCO operates monitoring programs to check for pollutants and toxins that may interfere with specific uses of the river."

Indeed, ORSANCO may be violating their original organizing compact agreements through this action, and opening up the distinct possibility of a much greater concentration of pollutants in the Ohio River than ever before.

In this we agree with statements made by Federal Commissioner, Tom Fitzgerald, and also with this statement: "It is a fairly accurate to say that the current management at the Environmental Protection Agency, at the national level, has signaled that there will be delays and possibly repeals of the number of provisions that directly affect discharges into this great River. Given the uncertainty that is occurring with respect to the national rules, I don't know that this is the time for us to signal a retreat from the historic function of the Commission of setting standards and encouraging the states to work cooperatively to assure that those standards are implemented." – [Tom Fitzgerald – ORSANCO Federal Commissioner]

On a local and personal level: I - as a WV resident who has dealt with our WV DEP on many issues - do not trust WVDEP to maintain the current level of water quality standards on the Ohio River, and I know they do not have adequate staffing to send enforcement officials to monitor the River, Industrial outflows, etc., for current standards. They aren't really able to keep up with the current amount of pipeline construction going on in WV, and - per DEP Sr. management level officials - they only plan to add 1-2 staff positions over the course of the next year. If ORSANCO leaves pollution control criteria setting and monitoring up to the states, I would bet there's a very low chance of WV officials maintaining standards that are adequate for the River to remain at its current level of health. There could be a catastrophic storm brewing...

In short, all Huntington residents – including many of OVEC’s members and staff, and my entire family - rely upon water from the Ohio River for our tap water. OVEC is based in Huntington, WV; both of WV American Water’s Huntington intakes are on the Ohio River. We are therefore, particularly vulnerable to a major pollution incident.

When the MCHM “plume” arrived in the Ohio River on its journey downstream in 2014, ORSANCO worked closely with local WVAW and other officials to monitor that plume – near Huntington. Without ORSANCO’s leadership on this type of monitoring, and their overall pollution control standards, I shudder to think what will happen during the next major pollution event. From our lessons learned in WV, it is not if, but when – in terms of the next major event of this magnitude.

Please vote against Option 2 in October, and find other ways to preserve and enhance pollution controls on the Ohio River. We need ORSANCO’s active oversight of these standards!

Thanks for your time!

Subject: Comments on Review of Pollution Control Standards
Date: Wednesday, August 01, 2018 8:25:27 AM

To Whom It May Concern:

I am writing on behalf of the City of Wheeling's Water Pollution Control Division regarding the Commission's review of its current Pollution Control Standards (PCS). The City of Wheeling WPCD strongly supports the Commission's adoption of Expanded Alternative 2, eliminating from the PCS both water quality standards/criteria and mixing zone/wastewater discharge requirements.

The City of Wheeling WPCD's wastewater treatment plant discharges into the Ohio River Basin and, therefore, is directly impacted by ORSANCO's Pollution Control Standards. For the reasons summarized in the January 18, 2018 comments submitted by the WV Municipal Water Quality Association, we urge the Commission to adopt Expanded Alternative 2 in order to avoid duplication of water quality standards regulation and to allow ORSANCO to focus its resources to deliver the greatest benefits to ORSANCO member states and the public at large.

Thank you for considering our input.

Sincerely,

Daniel P. Villani

Subject: Ohio River- Chemical Dumping and Pollution
Date: Wednesday, August 01, 2018 1:14:49 PM

Hello...

On behalf of the City of New Albany and New Albany Parks and Recreation, a city that was established in the 1800s on the Ohio River, an increase in any chemicals, dumping, and other forms of pollution would be a huge detriment to our newly revitalized and thriving town.

Over the past 8 years, New Albany has begun rehabbing its city and riverfront, adding stores, restaurants, hotels, repaving/adding stop lights/and turning its streets into two-way streets, along with beginning plans to develop the riverfront with which it built on as its main attraction. Plans for the riverfront include a new boat ramp, walking and biking trails, camping, workout and meditation spaces, restrooms, water recreational activities, various gathering spaces, rehabbed basketball courts, playgrounds, skate park, and amphitheater, among many other things. The Ohio River is a huge part of our establishment and survival, utilizing it as a main attraction for health and wellbeing for boating, fishing, swimming, rest and relaxation. Polluting the river more than it already is, deters people from everything we are working hard to build and attract them to.

Also as someone who's home growing up literally backs up to the Ohio River and who has spent every summer wakeboarding, tubing, knee-boarding, and swimming in the Ohio River, it would be devastating to see this opportunity ripped away from people.

Preserving our natural resources should be the number one priority.

Thank you,

Alicia

LWVCA COMMENTS ON ORSANCO'S ALTERNATIVES TO Pollution Control Standards

August 1, 2018

The Ohio River Valley Sanitation Commission met in June in Louisville, and reached the decision that follows:

"In recognition of the successes of the federal Clean Water Act and the related state water pollution control programs of member states, the Pollution Control Standards (PCS) should be revised by adding a provision that recognizes that water quality standards and criteria, as well as mixing zone requirements, and other provisions of the PCS are being adequately addressed by member states in accordance with programs appropriate for implementation of the federal Clean Water Act. To the extent that all member states are operating under such programs, the Commission may conclude that it need not continue the triennial review process related to the water quality criteria (and related provisions) of the PCS."

We strongly disagree that state-level pollution control standards are adequate.

From the beginning, the League of Women Voters has a strongly held position protecting clean water and safe drinking water. ORSANCO has proposed new alternatives to avoid redundancy between state standards and the USEPA, alternatives that have the potential to negatively impact the health of the Ohio River.

It is no secret that the Ohio River is far from clean. This drinking water source for more than 5 million people has been named the most polluted river in the USA for the past seven years. In 2014, more than 24 million pounds of industrial wastes and chemical were dumped into the Ohio River. As of 2015, there were 188 instances in which ORSANCO had set a standard for a pollutant that neither a member state nor EPA had set a standard for. And there were 252 instances in which ORSANCO standards were at least 10 percent more stringent than those of member states or the EPA. The money required to maintain the Pollution Control Standards is a small fraction of ORSANCO'S total budget.

If all Ohio River states have to develop their own standards, then the situation can lead to interstate conflicts when an upriver state has weaker standards that lead to increased pollution treatment costs for a downriver state. This would, inevitably, lead to litigation among the states. Therefore, we support a consistent of Pollution Control Standards for the Ohio River

To: PCS
Subject: Reject ORSANCO Commission Proposal #2

Objection to Proposal #2 to relinquish the power of ORSANCO to regulate and enforce water quality standards on the Ohio River and its watershed.

By Michael C. Miller, Emeritus Professor of Biological Sciences and Environmental Studies, University of Cincinnati 1970-2010. Vice President of Rivers Unlimited and of Friends of the Great Miami, Board member of Mill Creek Alliance, Oxbow, Inc and coordinator for Green Umbrella's Watershed Program database STEAMBANK

As one who has studied the chemistry and biology of the Ohio River since 1970 after the implementation of NEPA (1968) and after the Clean Water Act (1972), I have seen the recovery of the Ohio River with US EPA standards adopted and enforced by our interstate compact ORSANCO. Their systematic collection of data from fish to water chemistry has allowed us to connect data with results in better biological diversity in a man-manipulated watershed. When this movement started protecting fish, benthos and macroinvertebrates with limits that safeguard LD50s were good enough to get started. But today we are looking at interactions between several potential chemical, biological, and physical stressors on our rivers system that may interact with climate change to challenge the now old fashion method of single chemical limits. The proposal to give up the power to set and promogulate water quality standards for the Ohio River mainstem and by default many of the tributaries, the ORSANCO board proposal 2, and remove ORSANCO from evaluating the effectiveness of those standards every three years will potentially weaken our ability in government to control the destiny of the Ohio River.

Ohio River-specific problems include: response to climate change (elevated temperatures, reduced oxygen saturation, low flows, pulsed flows), control of invasive species (Silver carp, Black carp, and , already in the system) and potential invaders (Great Lake gobies, European ruffe), inability to respond to unique problems with the Ohio River (spills, barge ports, transport of hazardous fracking waste, etc.), unique discharge problems from one state that may have degradative impacts on the biota of another state, inability to respond to more dredging as sand becomes limiting for development nationwide, endangered species enhancement at water quality standards different than the USEPA national standard.

In addition we have found out recently how vulnerable our environmental laws are to attacks from high federal office for political and non factual reasons, that may not be advantageous to the biotic health of the Ohio River, when those deviations from current standards are designed to favor one industry. We have both state EPAs and our federal water quality standardds; however these are generalized for human health and recreation and for health of the native organisms usually over the whole state or national ecoregion, but these controls cannot respond to unique problems in the Ohio River, or standards that may vary along the river required by the differences in chemistry from runoff from metamorphic rock to sedimentary rock from upriver to down river. We need the third layer of support for the states in the Ohio River drainage, just like the Upper Mississippi River drainage.

The review of standards every three years could be changed in the charter by the Commission to once every 5 or 7 years to reduce costs, more consistent with the Ohio and federal EPAs. This reduction in frequency of review should reduce the annualized costs over the once in three year reviews, saving ORSANCO money. They could adopt federal EPA water quality standards for the most part where deemed appropriate, but would reserve them the ability of enforce a unique standard where necessary to support the health of the Ohio River.

ORSANCO does its own studies revealing the uniqueness of the regions along its 981-mile course. Recently a study of total dissolved solids (conductivity), one on impact of Bromides on drinking water treatment for the drinking water utilities, and now one on mercury sources, fate and effects as coal-fired powerplants have replaced areal dispersal with water dispersal of coal-bound mercury. As we put

hydroelectric plants on 6 of our lock and dams, what will be the effect of climate induced low flows, that may set of toxic cyanobacterial blooms.

ORSANCO does not regulate water flows (USACE), nor monitor climate change directly (NOAA and USACE), but it can sound the alarm and work with other agencies to amend current procedures as these affect water quality standards and set standards unique to the Ohio River. I have not agreed with all ORSANCOs decisions on the standard they have set; however they have a public and open, transparent process for us to have some impact on their decision. The Ohio River needs the special care that the power to regulate water quality on the river gives them now. Giving up that power to save a few dollars when other options exist should be explored first: more time between reviews (5-7 years), alternative funding (special fishing permit for Ohio River, tax on boat gasoline and diesel, tax on barge industry for their monitoring, integration of water quality monitoring by all agencies operating on the river, its influents and discharges may reduce costs if they approve the laboratory.

This reduction in reviews and setting water quality standards will require the states to increase or renew their monitoring of the Ohio River. Ohio, a leader in biocriteria for water, under the direction of Randall Sanders began nighttime electrofishing in the 1970s, a practice adopted then by ORSANCO. In 2000s we began monitoring the length of the Ohio River in our River Runs 2001-2007 for chemistry, chlorophyll and algal IDs, practices that ORSANCO has partially adopted. The USEPA began monitoring rivers on a random pattern, not just at convenient bridges and facilities, now adopted by ORSANCO.

Research on the river has changed monitoring to understand the longitudinal processes of the river. Presumably this will continue, but the implementation into standards will require each state to use their data and come to independent conclusions about their standard.

Standards for water quality, for mixing zones or not, for appreciation of exposure routes (e.g. Hg) would require new state expenditures.

Ohio has standards for Lake Erie drainages, and Ohio River drainages.

Now it will need an Ohio River specific set of standards that in currently does not have. Large rivers like the Missouri, Ohio and Mississippi need unique care to maintain big river fish (paddlefish, mooneye, goldeneye, river shiner). Large rivers are light-limited systems 95% of the time and have high particulate loads that affect chemistry differently than mid-sized rivers. Let's leave that to ORSANCO for determination through their Commission and for enforcement should it be required. Do not accept proposal #2.

Subject: Comments regarding Pollution Control Standards
Date: Saturday, August 11, 2018 1:28:59 PM
Attachments: [LSC ORANSCO Response.docx](#)

8/11/18

I am writing on behalf of Loveland Sustainability Council (LSC) related to the Commission's review its Pollution Control Standards (PCS). LSC does not want this commission to abdicate its authority and responsibility for setting regional unified pollution control standards, in fact LSC would advocate for the Commission to make existing regulations stronger, since the Ohio River is one of the most polluted rivers in the country. This aligns with over 97% of the responses from the 900 pages of first round public comments that call on the Commission to reject Alternative 2. There are several reasons why LSC strongly opposes Alternative 2 and is in favor of Alternatives 3 or 4 as acceptable options.

Alternative 2 fails to protect human health through its abdication of the PCS to the states along the Ohio River. As noted at the July public hearing, ORSANCO's has more than 100 additional regulations than the state of Indiana. This is true of the other states along the Ohio River. These inconsistencies will result in additional pollutants in water, especially downstream from states with less stringent, scientifically based standards. The current ORSANCO standards are based on 70 years of scientifically based research to protect life. There is no reason to withdraw these standards. It is fine for states to exceed these standards; it is NOT okay for states to have weaker standards. ■

Alternative 2 fails to protect the environment through its abdication of the PCS to the states along the Ohio River. As noted above, state regulations differ causing harmful effects on the environment (for example, water polluted in Flint Michigan or GenX polluting NC water). In a system of checks and balances, where redundancy serves the important purpose of ensuring high quality standards are regulated and enforced, ORSANCO's regulations are critical as a back up to the EPA and state regulations. Human life, aquatic life and a healthy environment are basic necessities for communities and businesses to grow and prosper.

The Ohio River needs a unified voice for PCS due to the complicated transboundary water quality problems that are inherent along the Ohio River. ORSANCO was established 70 years ago to provide consistent regulations between the states that the Ohio River flows through, regardless of individual states laws or federal regulations. Alternative 2 abdicates this critical role that ORSANCO was meant to provide. ORSANCO's voice and regulations are needed to address complicated pollutant questions that arise, especially where the federal government has chosen not to act.

Options 3 and 4 continue to foster cooperation and collaboration between member states and ensure that states comply with unified pollution standards. It is essential that we protect human life, aquatic life, the environment with scientifically based standards that are unified and consistent along the Ohio River and the many boundaries it flows through.

Sincerely,

Amy Van Strien

RE: Comments on the ORSANCO Proposed Revision to the Pollution Control Standards

West Virginia Rivers Coalition, on behalf of our members – many of which rely on the Ohio River as their source for drinking water and river recreation – urge to you oppose the adoption of Alternative #2.

We strongly support the detailed rationale for why Alternative #2 must be rejected provided in comments submitted by National Wildlife Federation and Environmental Law & Policy Center.

Our primary concerns shared by our members in considering Alternative #2 can be summarized as follows:

There will be protection gaps and inconsistencies. Across the eight states in the Ohio River basin, there are a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states. WVDEP is currently proposing revisions to its human health criteria in its water quality standards which rely on WV-specific fish consumption data. This is an example of how criteria calculations will continue to vary from state-to-state providing for an unlevel playing field for permittees.

States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for toxins that do not already have a state standard.

Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that could lead to pollution related issues for downriver states.

It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Additionally, Alternative #2 cannot be adopted because it would conflict with the by-laws of the Commission, and with ORSANCO's Strategic Plan and the interstate compact itself.

Thank you for your consideration of these comments. We hope you will keep progress on improving the water quality of the Ohio River by maintaining ORSANCO's pollution control standards and rejecting Alternative #2.

Re: Comments on PCS

I oppose and object to the proposed changes to the Pollution Control Standards (PCS) and ask that ORSANCO retain the language passed in 2015. I have lived most of my life in the Ohio River Basin and have spent considerable effort over the decades working to protect and improve the Ohio River. I have participated in the PCS triennial review consistently since 2005. While I have sometimes objected to proposed changes never before I have I felt that ORSANCO was completely abdicating its mission “to ensure protection of these uses and to preserve the waters for other legitimate purposes” if it proceeds with the adoption of the changes proposed to the PCS. It is difficult to properly and completely express my disappointment in the Commission for abandoning its mission and forsaking its authority. Except to state that I will resign from the PIACO as I see no further reason to volunteer to serve an organization that has abandoned its mission.

I’ve had the opportunity to work with other multi-state commissions on large rivers. These commissions had difficulty cleaning up large interstate waterways precisely because they lacked the authority granted to ORSANCO in the Compact to ensure that “pollution by sewage or industrial wastes originating within a signatory State shall not injuriously affect the various uses of the interstate waters.” ORSANCO purports that the Standards are not needed because the individual states now have NPDES programs and water quality standards that must be approved by EPA under the CWA when a number of ORSANCO standards are more stringent than state standards.

But several states in the Compact, including Kentucky, have prohibitions against standards that are more stringent than the EPA and so for a number of states, permits will be less stringent if the Commission votes to approve these changes and abdicates its responsibility to protect the river. This will certainly not result in improved water quality in the Ohio River. It will likely not even result in the status quo for water quality.

US EPA addressed the very issue at the crux of ORSANCO’s assumption in a study, titled *A Study of Prospective Water Pollution Control Activities For The Ohio River Valley Water Sanitation Commission*, was released in March 1975, and with respect to “stream standards,”

recommended that:

Since the Ohio is a boundary river, and because there are many other relationships as among the several state segments of the river system, the interstate agency should provide the overall view and the comparative analyses needed for coordination, consistency and equity.

Whereas the current PCS state: “Sections 301(b)(1)(C) and 510 of the Federal Act require that permits issued under that system incorporate applicable standards promulgated by an interstate agency wherever they are more stringent than comparable state or federal standards. And that these standards set forth the uses to be protected in the Ohio River (Chapter 2) as established in the Compact, establish water quality criteria to assure that those uses will be achieved (Chapter 3), and set wastewater discharge requirements (Chapter 5) needed to attain the water quality criteria. The standards also recognize the rights of individual states to adopt and apply more stringent regulations.

Specific wastewater discharge requirements are established in these regulations and must be incorporated into discharge permits issued under the authority of the NPDES or state discharge permitting programs when they are more stringent than:

- 1) applicable U.S. EPA technology-based effluent guidelines required under Sections 301, 304, 306, and 307 of the Federal Clean Water Act, or
- 2) any state treatment requirements, effluent standards, or water quality-based effluent limits.

In the absence of promulgated Federal effluent guidelines pursuant to Sections 301, 304, 306, and 307 of the Clean Water Act, the Compact signatory states have the responsibility to establish effluent limitations to be included in any discharge permit, consistent with the standards contained herein using best professional judgment on a case-by-case basis.”

This is in no way comparable to the Commission simply stating that because state standards are approved by EPA that the river as a whole will be protected. Standards vary state by state. Currently, the PCS regulations require that states use ORSANCO standards or a state standard if it is more stringent. Therefore, the protections will not be consistent or as stringent if these changes are approved and the PCS regulations are gutted.

I continue to assert that some combination of alternative 3 and/or 4 as presented in the preliminary comment period will provide better protection for the Ohio while adhering to the Compact and the mission of the Commission. In addition, a combination of 3 and 4 would also implement the recommendations in the 1974/5 EPA study and continue ORSANCOs legacy of

providing valuable leadership to the Ohio River states. What the Ohio River needs is coordination, consistency and equity. Proposing a cost effective way to selectively modify the PCS after review as warranted and increase focus on harmonization of standards and their implementation among Compact states and EPA would preserve ORSANCOs leadership role in the basin.

I object to the proposed changes. I am not alone. I read the entire transcript of the public hearing and not a single person who spoke, spoke in favor of the proposed changes. If approved ORSANCO is abandoning its mission and obligation to the people of the Ohio River Basin, but even worse, the water quality and quality of life of people in the Ohio River Basin will continue to suffer.

Subject: Green Umbrella's Pollution Control Standards Public Comment
Date: Wednesday, August 15, 2018 12:34:34 PM

To Whom it May Concern:

Green Umbrella would like to submit the following comment regarding the Pollution Control Standards review:

"The Ohio River Valley Water Sanitation Commission (ORSANCO) recently re-evaluated its Pollution Control Standards (PCS), and has decided to pursue a set of revisions known as Alternative 2 that would, among other things, eliminate the Water Quality Criteria developed specifically for the Ohio River. Green Umbrella and the Green Umbrella Watershed Action Team (WAT) believe that Alternative 2 is not in the best interest of the Ohio River as a whole and that it does not support the chemical, physical or biological integrity of the river. The WAT recommends that the Pollution Control Standards for the Ohio River remain intact and in place and that the three-year review period for the PCS be extended to five years, thereby alleviating some of the financial burden associated with the review.

Thank you for the opportunity to submit comments."

Sincerely,

Rashida Manuel

[image008.png](#)

Dear ORSANCO,

On behalf of the hundreds of conservationists that make up the Indiana Wildlife Federation, we urge ORSANCO to keep the Pollution Control Standards in place for the all Ohio River compact states. We believe that these standards are critically important to Indiana because we located near the end of the Ohio River's 981 mile stretch, therefore downstream of a lot of potential hazards. Please protect the habitat and wildlife that rely on clean water to thrive in their environments, and protect the water that thousands of citizens rely on for clean drinking water and safe access to aquatic outdoor recreation areas.

Here are some other compelling facts about the ORSANCO Pollution Control Standards that indicate they are working and need to remain in place.

- In EPA records, there are 190 permits for releasing waste into the Ohio River before it reaches the eastern edge of Indiana, including from oil and chemical industries.
- 30 towns and cities use the Ohio River for drinking water
- 188 ORSANCO standards cover chemicals that are not covered by state standards in any of the Ohio river states
- 252 ORSANCO standards are significantly more protective than the corresponding state standards, by 10% or more.
- In an ORSANCO staff report comparing water quality standards, there are 54 chemicals with ORSANCO standards but no Indiana standard and 63 chemicals with weaker Indiana standards than ORSANCO standards.
- ORSANCO standards are cited in Indiana's Administrative Code for water discharge permits at 327 IAC 5-2-10. Their loss will leave a gap that will require Indiana to spend time and taxpayer money to fix.

Thank you for your time and consideration,

Dear Sir or Madam:

I am the Metro Councilman for Louisville's District 9, which borders the Ohio River and includes Louisville Water's Zorn Pump Station. I am writing to express my opposition to the proposal by ORSANCO to amend its Pollution Control Standards (PCS) by eliminating water quality standards and criteria, as well as mixing zone and wastewater discharge requirements, from the rules, and by making changes to other sections of the PCS.

My reading of the minority report indicates that there are many parameters among the six signatory states and EPA, for which ORSANCO has a criteria but the state or EPA does not. If that is true, how can anyone conclude that the ORSANCO standards are redundant? We should celebrate and enforce – not eliminate – pollution standards that exceed what states or the federal government would otherwise follow.

I also agree with the minority report that we need an independent body that 'is able to research, develop, propose, and adopt standards tailored to the specific needs of the river in an atmosphere that stresses sound science and data-driven policy.'

I am deeply concerned that this proposal has been advanced by companies which are already polluting the Ohio River and saddened that more people who represent the public haven't spoken up to oppose the elimination of the standards. The very idea that an interstate commission tasked with overseeing the health of the Ohio River is considering eliminating its pollution control standards – which are not duplicative of other protections - is offensive and a significant step backwards.

In Louisville, we rely on water from the Ohio River and we count on ORSANCO and its PCS to help keep it clean. Please keep them in place.

Sincerely,

Councilman Bill Hollander | Ninth District Councilman

Dear ORSANCO Pollution Control Standards Committee & Commissioners:

I comment as a former ORSANCO Commissioner, retired Director of the Kentucky Kentucky Division of Water and one time Director of the Division of Authorization and Compliance for Ohio EPA>

I object to the currently proposed changes to the Pollution Control Standards. I urge you to retain the standards and language adopted in 2015. I realize that in some cases those standards are more stringent than an individual state standards. I recognize that is sometimes awkward for an individual state but current language assures consistency and equity in state issued NPDES permits for the Ohio River and allows ORSANCO to provide the coordination among state agencies and EPA that is the role of ORSANCO.

ORSANCO has worked for decades to improve and protect the Ohio River. This is not the the time to reduce those efforts

RE: Comments on ORSANCO's Pollution Control Standards (PCS)
Triennial Review

To Whom It May Concern:

AK Steel Corporation (AK Steel) is pleased to submit these comments on the Commission's proposed revisions to the ORSANCO Pollution Control Standards – 2015 Revision (the PCS). These comments reiterate and supplement the comments submitted by AK Steel on February 23, 2018 in response to the Commission's previous request for comments on this subject. AK Steel appreciates the historical role of ORSANCO in helping to protect and preserve water quality in the Ohio River and in collecting and disseminating water quality data and information to the States and the public. The Commission's recent proposal is an important and timely response to the significant regulatory developments and improvements in water quality in the Ohio River that have occurred in the 70 years since ORSANCO was formed.

Summary of Comments

AK Steel believes that the Commission's proposed revisions to the PCS reflect a sensible approach to satisfying the goals of the ORSANCO Compact, ensuring the continued protection of water quality and aquatic life in the Ohio River, while avoiding the imposition of regulatory burdens that have become both unnecessary and duplicative under the current legal framework. As noted by the Commission, ORSANCO was created in 1948, at a time when the need for water quality improvements in the Ohio River was clear. There was an absence of an effective regulatory framework to address critical needs. Since that time, and as a result of the enactment of the federal Clean Water Act and related laws, a comprehensive system of federal and state water quality programs and standards has been developed and implemented in all of the ORSANCO Compact States. The result has been a dramatic improvement in the quality of the Ohio River, as well as its tributaries and other streams throughout the Compact States.

Today, each of the Compact States is implementing a federally-enforceable water quality program approved by the U.S. Environmental Protection Agency (USEPA) pursuant to the Clean Water Act. Each of those programs includes designated uses, "free from" mandates, water quality standards, wastewater discharge requirements, mixing zone provisions, and enforcement authorities. Each of these requirements is reviewed and approved by USEPA to ensure that it meets the requirements of the Clean Water Act, thereby providing consistency and predictability

across the States' programs. Those programs have been effective in addressing each State's streams as aquatic habitats, as well as supporting their uses for recreation and drinking water.

Whereas the ORSANCO PCS may have played a meaningful role in protecting water quality when the Compact was first signed, they have become duplicative of the subsequently enacted federal and state water quality programs established under the Clean Water Act. Today, the water quality goals of the Compact are being effectively addressed by the Clean Water Act, and the PCS provide little, if any, additional environmental benefit to the Ohio River. In fact, the differences between the PCS and Clean Water Act standards can lead to confusion for the States and the regulated community, and can create complications in the permitting process, where there is often no effective way to question or challenge the appropriateness or applicability of the underlying PCS in specific permitting situations.

AK Steel believes that the most valuable role ORSANCO can play in meeting the goals of the ORSANCO Compact in the current regulatory environment is to concentrate on its longstanding scientific and technical information gathering and research. This role allows ORSANCO to continue to provide important information to the States in carrying out their obligations to preserve and protect water quality under the Clean Water Act, and in helping to coordinate and promote consistency among the various States in the Ohio River basin. This is a unique role that only ORSANCO can perform in the current framework and is certainly its highest and best use.

About AK Steel

AK Steel Corporation is one of the few remaining independent steel manufacturers based in the United States, with nine (9) steel manufacturing facilities located in Indiana, Michigan, Ohio, Kentucky, West Virginia, and Pennsylvania and with total employment of approximately 10,000 people. AK Steel has three facilities located on the Ohio River, including Mountain State Carbon in Follansbee, West Virginia; the AK Steel Ashland Works in Ashland, Kentucky; and the AK Steel Rockport Works in Rockport, Indiana. Collectively, these three facilities currently employ between 750 and 1,500 people, depending on business conditions, and provide critical manufacturing, finishing and support services to the other AK Steel facilities. Environmental programs at these facilities require substantial investments in pollution control facilities and substantial ongoing operating and maintenance costs to ensure clean air and water.

The Ohio River is an important resource to AK Steel, both as a contributor to the quality of life of its employees and the communities in which it operates and as a source of plentiful, high quality water to support AK Steel's operations. Thus, maintenance of the quality of the Ohio River's water is important to AK Steel. AK Steel has a long-standing tradition of working cooperatively with environmental regulators in West Virginia, Kentucky, and Indiana to ensure that its operations achieve and maintain compliance with all applicable standards, including those applicable to the Ohio River, and that any instances of non-compliance are remedied expeditiously. Process wastewater, non-contact cooling water and storm water discharges from each of AK Steel's facilities on the Ohio River have been regulated effectively for many years by State-issued NPDES permits. These permits contain both technology-based effluent limits

derived from 40 CFR Part 420 and water quality-based effluent limits derived by the States under the CWA.

Detailed Discussion of Proposed PCS Revisions

AK Steel believes that the Commission's proposed PCS revisions are both appropriate and consistent with the mandates of the ORSANCO Compact. The ORSANCO Compact establishes certain minimum requirements for the Commission, its staff, and the signatory States, including:

- Article I requires the States to “enact any necessary legislation” to reach certain general goals identified in Article I, but does not mandate any specific standards or requirements.
- Article VI sets certain limited, baseline treatment requirements for discharges of sewage and industrial wastes (primarily settleable solids and TSS limits for sewage), but grants *discretion* to the Commission to determine *if* additional treatment standards are needed to protect public health or to preserve the waters for other legitimate purposes.
- Article VII preserves the rights of signatory States to adopt more stringent standards than those required by Article VI.
- Article VIII requires ORSANCO to survey and study water pollution in the Ohio River drainage basin and to publish a comprehensive report on its findings.
- Article IX gives ORSANCO powers to enforce its standards and requirements.

Thus, ORSANCO must continue to exist and function to meet these basic requirements. But beyond these baseline requirements, the Commission is given wide latitude to determine whether additional pollution control standards are necessary, or whether ORSANCO must even adopt or maintain its own regulations or pollution control standards to meet the minimal goals of the Compact, given the existence of mandatory federal and state regulatory programs that address those same goals.

AK Steel believes that the Commission is well within its rights to determine – after investigation, due notice, and hearing – that the bulk of the Pollution Control Standards are no longer necessary in light of the subsequent implementation of the Clean Water Act and its comprehensive water quality and permitting regime. Nothing in the Compact, ORSANCO's By-Laws, or the Pollution Control Standards undercuts this conclusion or requires the adoption of more extensive standards. The Commission simply needs to determine that the Compact's goals of protecting public health and preserving other legitimate purposes, including those listed in Article I, are satisfied by the States' implementation of the Clean Water Act permitting programs. With this proposal, the Commission has correctly concluded that is the case.

In support of this conclusion, AK Steel notes the following:

- The PCS are largely duplicative of the States' water quality standards adopted pursuant to the Clean Water Act. Beneficial use designations are essentially the same. Most water quality criteria are either the same or provide the same degree of human health and aquatic life protection. Mixing zone designations are similar. Given federal and State technology-based discharge requirements and water quality-based limits, the PCS

wastewater discharge requirements are superfluous for most categorical industrial dischargers and municipal dischargers.

- Where there are differences between the ORSANCO PCS and state water quality criteria and implementation procedures, the PCS, which must be implemented by the States, sometimes result in NPDES permit conditions that are more stringent than otherwise required by the States standards – with no demonstrable environmental benefit.
- The implementation of the ORSANCO PCS creates confusion for the States and regulated entities. Unlike state water quality standards development and implementation, the process for adoption of the PCS provides no opportunity to challenge the appropriateness or applicability of the PCS. The result is that if a regulated entity believes that a particular PCS requirement is inappropriate, its only option is to challenge that requirement as applied in the entity's NPDES permit – a process that does not allow the permittee to challenge the underlying soundness of the PCS and deprives permittees of regulatory and legal due process. Moreover, implementation of the PCS creates a separate set of standards that apply only to the Ohio River, and that differ from the standards that apply throughout the remainder of each of the Compact States. Eliminating this confusion will improve regulatory consistency and promote clarity for the regulated community.
- Today the regulated community faces a continual increase in the amount and complexity of environmental laws and regulations, with finite company resources available to stay abreast of the latest developments and ensure compliance. The ORSANCO PCS add another layer of complexity on top of the already expansive federal and state regulatory scheme governing water quality. Companies should not be faced with the choice of either dedicating significant additional resources to monitoring the ORSANCO PCS development process, or simply hoping that the implementation of the ORSANCO standards does not result in the inclusion of unworkable requirements in their NPDES permits – particularly if the PCS are no longer necessary to meet the water quality goals for the Ohio River.
- The proposed PCS revisions would relieve ORSANCO of the significant administrative and scientific/technical burden of periodically reviewing and updating water quality criteria for the many conventional, non-conventional, toxic metal, and toxic organic pollutants currently regulated under the PCS. Under the Clean Water Act, USEPA does the “heavy lifting” in this regard by developing and updating recommended water quality criteria based on advances in aquatic toxicology, the latest information on the impacts of pollutants on human health, and other highly technical factors. The ORSANCO Compact States use the USEPA-recommended criteria to fashion their respective State water quality standards, subject to potential modifications to reflect State-specific circumstances. Because the State water quality standards must protect designated human health, aquatic life, recreational, and other designated uses of the

Ohio River, and because they must be approved by USEPA, the public can be assured that the fundamental goals of the ORSANCO Compact and the Clean Water Act, as applied to the Ohio River, are being addressed in a comprehensive manner.

- The resources ORSANCO currently devotes to the PCS program can be more effectively used to support other ORSANCO programs that do not overlap with state and federal water quality programs, and that provide real added value to the States. ORSANCO has particular skill and expertise in assessing water quality and the biological integrity of the Ohio River, disseminating that information to the States and public to ensure coordination and consistency among the States' regulatory programs and other water quality initiatives, engaging in public outreach, and assisting in spill detection and response through information-gathering and coordination. These functions can provide meaningful and long-lasting benefits to water quality throughout the Ohio River basin by providing support to the States in satisfying their Clean Water Act obligations without unnecessarily wasting regulatory resources and creating confusion for the regulated community.
- Most importantly, the beneficial uses of the Ohio River associated with nearly all PCS water quality criteria are being achieved throughout the River with a small number of exceptions. And even those few exceptions are being addressed through the States' Clean Water Act-mandated programs, under the oversight of USEPA, which works to ensure consistent Clean Water Act compliance across all States.

AK Steel recognizes the concerns identified by some Commissioners and members of the public regarding the proposed PCS revisions, but believes that those concerns, while sincere, are unfounded. First, while it may be true that the ORSANCO PCS contain water quality criteria for some parameters that are not covered by comparable state or federal criteria, it is not necessarily true that the maintenance of those additional ORSANCO criteria is necessary to protect the aquatic life and uses of the Ohio River. Under the Clean Water Act, States are required to develop and enforce water quality criteria to protect aquatic life and designated uses of all streams, including the Ohio River. And USEPA is charged with ensuring that each State's water quality program satisfies the requirements of the Clean Water Act. Thus, the concern that reliance on the States' standards "may not be adequate to protect the aquatic life and uses of the Ohio River" ignores the basic reality and requirements of the Clean Water Act, the States' EPA-approved programs, and their application to the Ohio River. In fact, the States' programs include criteria for over 100 pollutants that are not covered by the ORSANCO PCS, belying the notion that they there are somehow lax. A copy of the approximately 138 pollutants regulated by the States, but not by ORSANCO, are attached for the Commission's reference.

It appears that ORSANCO may be unnecessarily regulating numerous pollutants – the 188 pollutants cited by opponents of the proposed PCS revisions – as proxies or indicators for the pollutants that "really matter," i.e., those that are regulated by USEPA and the States under the Clean Water Act. Thus, ORSANCO's current regulation of numerous additional pollutant parameters beyond those required by the Clean Water Act may be neither legally nor

scientifically necessary, nor necessary to ensure the achievement and maintenance of high quality water and aquatic values in the Ohio River. Regulation should be focused on achieving the States' water quality goals for the Ohio River, not simply regulating as many pollutant parameters as possible without regard for necessity or effectiveness.

Second, some have expressed a concern about a possible lack of coherent implementation across the various State programs with respect to the water quality standards and policies applicable to the Ohio River, and thus the purported need for ORSANCO to enforce such coherence and, presumably, uniformity across all States. This concern overlooks the explicit decision by Congress to embrace the concept of cooperative federalism in the regulation of the Nation's waters, as seen in the basic design of the Clean Water Act and its implementing programs. Under that approach, each State is given leeway to develop its own water quality standards and policies in light of unique local conditions, needs, and priorities. But that leeway is subject to the oversight and approval of USEPA, whose broad perspective and mandate ensure that the States are individually and collectively meeting the fundamental water quality goals of the Act. ORSANCO need not duplicate the role of USEPA. There is no need to impose a "one size fits all" solution throughout the Ohio River basin, as long as each State is implementing a water quality program that meets the underlying goals of the Clean Water Act. This approach serves to protect the Ohio River as a whole while recognizing the unique needs, particular circumstances, and local knowledge within each State.

Yet some public commenters appear to implicitly question the wisdom of Congress in establishing the basic structure of the Clean Water Act and to doubt the capabilities and, indeed, the trustworthiness of the States and USEPA to fulfill their prescribed roles under the Clean Water Act. Some also have questioned whether the proposed PCS revisions will result in overburdening the States. However, each of the ORSANCO member States currently administers a Clean Water Act program that meets the stringent requirements of the Act, including setting and regularly updating water quality standards for all waters in the State, issuing NPDES permits, performing water quality certifications, requiring regular monitoring and evaluation of waters, enforcing strict sampling and testing requirements, and satisfying a host of other Clean Water Act requirements. And each of those programs is subject to the regular oversight and approval of USEPA. The States have ample technical expertise and experience to handle their responsibilities, and USEPA has the most extensive resources in the Nation to oversee, approve, and assist in the States' respective programs -- certainly far greater than those of ORSANCO. Of course, ORSANCO can provide valuable assistance to the States in the form of collecting and evaluating water quality data from the Ohio River, disseminating that information to encourage consistency, and making other technical recommendations. But the States, with the oversight of USEPA, are clearly capable of fully and effectively regulating their waters, including the Ohio River and its tributaries, to meet the Clean Water Act's strict requirements.

Third, those who have expressed concerns about "the vagaries of the political process" overstate the role of "politics" in the federal-state Clean Water Act regulatory program and also belie a troubling lack of confidence in the citizens' elected representatives. In fact, the ongoing development, review and implementation of the States' water quality programs, including the

strenuous triennial review process required under the Act, ensure that those water quality standards are data-driven and reflect sound science. Moreover, it is entirely appropriate for federal and state regulatory programs to ultimately reflect the Nation's current policy preferences as articulated by Congress and the States' legislatures, as those bodies reflect the will of the citizenry regarding how to balance environmental protection, economic growth, and other important social factors. AK Steel is confident that the current federal-state partnership under the Clean Water Act has resulted in dramatic water quality improvements over the past several decades and will continue to protect and preserve the quality of the Nation's rivers and streams, including the Ohio River.

Finally, AK Steel disagrees with the comments of those who would maintain the PCS in their present form, or even expand the scope of the PCS and the regulatory role of ORSANCO along the Ohio River. Given the complexity of the PCS and state water quality standards and implementation procedures, such an expansion would likely consume an inordinate amount of ORSANCO and State resources and time, would create more duplication and inconsistency, would not likely yield much in the way of real environmental benefit, and is not necessary to meet the goals of the ORSANCO Compact. In a time of limited resources and a need for greater cooperation and efficiencies, creating a super-regulatory regime for ORSANCO, on top of the already stringent requirements of the Clean Water Act, would be wasteful and inadvisable.

In sum, AK Steel believes that the proposed revisions to the ORSANCO PCS are both appropriate and advisable because they will help maintain the beneficial uses of the Ohio River consistent with the mandates of the ORSANCO Compact, while removing the duplicative and resource intensive aspects of the PCS. And they will allow ORSANCO to concentrate its resources on those tasks that it can best perform to help promote and preserve water quality in the Ohio River.

AK Steel commends the ORSANCO Commission for engaging in an extended public review process for the proposed PCS revisions, beginning with the creation of the Ad Hoc Committee on Water Quality Standards Implementation nearly four years ago. Beginning in late 2014, the Ad Hoc Committee engaged in a careful review of ORSANCO's historical and current role in water quality standards implementation and published a white paper in April 2017 that evaluated five alternative approaches to ORSANCO's continued implementation of the PCS. The ORSANCO Technical Committee and each of its standing advisory committees, representing various river users, watershed organizations, and regulated entities, submitted detailed comments on those alternatives. A subsequent round of preliminary public review and comment in early 2018 resulted in the receipt of hundreds of pages of written comments from individual citizens, environmental organizations, regulated businesses, and other interested parties. After reviewing those comments, the Commission voted in early June 2018 to subject the current proposal to an additional round of formal public review, scheduled to conclude on August 20, 2018. As evidence of the success of these efforts, a public hearing on the proposal, held on July 26, 2018, yielded a standing room only turnout. The ultimate product of this multi-year effort is an exhaustive, thorough, and fully transparent public review process that has put the Commission in

the best possible position to make a fully-informed decision on this proposal, and AK Steel applauds the Commission and its staff for their outstanding efforts.

Thank you for the opportunity to comment on the Commission's proposed revisions to the ORSANCO PCS. If you have any questions, I can be reached at 724-284-2267 or by email at russ.dudek@aksteel.com.

Sincerely,

Re: Comments on ORSANCO's Pollution Control Standards (PCS) – Triennial Review

To Whom It May Concern:

The Kentucky Chamber of Commerce (the Kentucky Chamber), Greater Louisville, Inc. (GLI), and the Northern Kentucky Chamber (NKY Chamber) appreciate the opportunity to submit comments for the second round of public review on the Commission's proposed revisions to the ORSANCO Pollution Control Standards – 2015 Revision (the PCS). The Kentucky Chamber and GLI originally submitted comment on Feb. 23 regarding the potential PCS revisions.

The Kentucky Chamber, GLI, and the NKY Chamber appreciate the role played by ORSANCO since 1948 in protecting and preserving water quality in the Ohio River and in collecting and disseminating water quality data and information on the river. We welcome the opportunity to provide input as the Commission assesses the role of ORSANCO in light of the significant regulatory developments that have occurred since 1948, including the enactment of the federal Clean Water Act and related state requirements, and the consequent improvements in water quality in the Ohio River. This is particularly important in a time of limited governmental budgets, which reinforce the need to eliminate unnecessary duplication. The Commission should ensure that the goals of the ORSANCO Compact are being met while not imposing unnecessary costs or complexities on business and local communities that hinder the economic health of the ORSANCO Compact States.

About the Kentucky Chamber, GLI, and NKY Chamber

-
The Kentucky Chamber of Commerce is the major catalyst, consensus builder, and advocate for a thriving economic climate in the Commonwealth of Kentucky. The Kentucky Chamber of Commerce supports a prosperous business climate in the state and works to advance Kentucky through advocacy, information, program management and customer service in order to promote business retention and recruitment. Representing the interests more than 68,000 employers across the Commonwealth, the Kentucky Chamber advocates for growth-oriented tax reform, infrastructure investment, workforce solutions, a sensible regulatory approach that satisfies the following criteria: scientific validity, technical feasibility and economic rationality, and a sustainable state government to ensure Kentucky is positioned for growth and opportunity.

-
As the Greater Louisville region's largest convener of business leadership, GLI leads economic and global outreach strategies focused on business attraction; nurtures the

entrepreneurial eco-system; and champions the development of the community's talent base. As the voice of Greater Louisville's business community, GLI advocates for a pro-business environment and facilitates businesses engagement on issues that impact regional competitiveness, such as sensible regulatory standards and compliance.

The NKY Chamber represents over 1,500 employers in northern Kentucky and the surrounding region. We enjoy a diverse economy, with broad representation of employment in all sectors of the economy, including manufacturing, distribution, agriculture, finance, and services. Our region is situated centrally to the majority of the population in the eastern United States, and is traversed by major interstates, rail lines and navigable rivers. Our region has enjoyed and is positioned for economic growth. We are committed to protecting human health and the environment and at the same time preserving and empowering a robust economic climate in our community.

The business and industry members of the NKY Chamber have operations throughout the state that are subject to water quality regulations and requirements. Accordingly, the NKY Chamber has a substantial interest in ORSANCO's Pollution Control Standards to ensure that any amendments to the standards do not unnecessarily restrict or inhibit business and industry in the Commonwealth.

Comments

The Kentucky Chamber, GLI, and NKY Chamber support the Pollution Control Standards (PCS) revisions proposed by the Commission as the most sensible and cost-effective approach to satisfying the goals of the ORSANCO Compact while recognizing the realities of the current regulatory environment. ORSANCO was created in 1948, at a time when the need for water quality improvements in the Ohio River was clear and the absence of an effective regulatory framework to address that need was critical. Since then, the federal Clean Water Act has been enacted and a comprehensive system of federal and state water quality programs and standards has been developed and implemented in all the ORSANCO Compact States. Today, those programs and standards are addressing the goals of the Compact, making the continued maintenance of a duplicative, and sometimes contradictory, set of ORSANCO Pollution Control Standards questionable at best.

Currently, each of the Compact States is implementing a federally-enforceable water quality program approved by the U.S. Environmental Protection Agency pursuant to the Clean Water Act. Each of those programs includes designated uses, "free from" mandates, water quality standards, wastewater discharge requirements, mixing zone provisions, and enforcement authorities. Those standards and requirements are designed to support each State's streams as aquatic habitats, as well as their uses for recreation and drinking water. Beneficial use designations are essentially the same. Most water quality criteria are either the same or provide the same degree of human health and aquatic life protection. Mixing zone designations are similar. Given State technology-based discharge requirements and water quality-based limits, the PCS wastewater discharge requirements are superfluous for most categorical industrial dischargers and municipal dischargers.

Whereas the ORSANCO PCS may have been necessary in 1948, before the enactment of the Clean Water Act, they are now duplicative of the comprehensive federal and state water quality programs required under the Clean Water Act. Today, the goals of the Compact are

being effectively addressed by the Clean Water Act, and the PCS provide little or no added environmental benefit. In fact, the differences between the PCS and Clean Water Act standards can lead to confusion for the States and the regulated community and can create unnecessary complexity in the permitting process. Moreover, there is often no effective way to question or challenge the appropriateness or applicability of the PCS in specific permitting situations. This can lead to the imposition of unnecessary, and unnecessarily stringent, permit requirements that serve no real purpose in protecting the water quality of the Ohio River, and that create an economic disadvantage for the communities and businesses that are located along the Ohio River.

Implementation of the PCS also creates a separate set of standards that apply only to the Ohio River, and that differ from the standards that apply throughout the remainder of each of the Compact States. Eliminating this confusion will improve regulatory consistency and promote clarity for the regulated community.

At a time when our States are looking for ways to promote community sustainability and economic growth, and to encourage investment in domestic industry, the ORSANCO Compact States can ill afford to impose an environmentally unnecessary and costly regulatory regime on the communities located along the Ohio River. Rather, the most valuable role ORSANCO can play in meeting the goals of the ORSANCO Compact is to concentrate on its scientific and technical information gathering and research. Resources currently devoted to the PCS program can be more effectively used to support other ORSANCO programs that do not overlap with state and federal water quality programs, and that provide real added value to the States. ORSANCO has particular skill and expertise in assessing water quality and the biological integrity of the Ohio River, disseminating that information to the States and public to ensure coordination and consistency among the States' regulatory programs and other water quality initiatives, engaging in public outreach, and assisting in spill detection and response through information-gathering and coordination.

The Kentucky Chamber, GLI, and NKY Chamber believe that the Commission's proposed revisions to the PCS are entirely consistent with the requirements of the ORSANCO Compact. The ORSANCO Compact establishes certain limited, baseline treatment requirements for discharges of sewage and industrial wastes but grants discretion to the Commission to determine if additional treatment standards are needed to protect public health or to preserve the waters for other legitimate purposes. Beyond these baseline requirements, the Commission is given wide latitude to determine whether additional pollution control standards are necessary, or whether ORSANCO must even adopt its own regulations or pollution control standards to meet the minimal goals of the Compact. The Commission is well within its rights to determine – after investigation, due notice, and hearing – that the Pollution Control Standards may no longer be necessary in light of the subsequent implementation of the Clean Water Act. The Commission is correct to take the steps to determine that the Compact's goals of protecting public health and preserving other legitimate purposes are being satisfied by the States' implementation of the Clean Water Act permitting programs, and given this determination the PCS are simply duplicative and an unnecessary burden on the States and regulated businesses.

In sum, the Kentucky Chamber, GLI, and NKY Chamber believe that the proposed PCS revisions maintain the beneficial uses of the Ohio River consistent with the mandates of the ORSANCO Compact, while removing the duplicative and resource intensive aspects of the PCS. And these sensible revisions will allow ORSANCO to concentrate its resources on those

tasks that it can best perform to help promote and preserve water quality in the Ohio River.

*

*

*

Thank you again for the opportunity to comment on these important revisions. The Kentucky Chamber, GLI, and NKY Chamber encourage the Commission to formally adopt the proposed PCS revision so that ORSANCO can play a more effective and efficient role in protecting and preserving the water quality of the Ohio River.

Subject: Comments of Utility Information Exchange of Kentucky on ORSANCO's Proposed Amendments to its Pollution Control Standards
Date: Friday, August 17, 2018 12:07:14 PM

To Whom It May Concern:

Pursuant to ORSANCO's public notice regarding proposed amendments to its pollution control standards (PCS) for the Ohio River, the Utility Information Exchange of Kentucky (UIEK) is providing comments on ORSANCO's proposed decision to rescind its water quality standards leaving that responsibility to the states under Section 303 of the Clean Water Act (CWA). The proposal was identified as Alternative 2 in the original public notice of options for revisions to ORSANCO's PCS. As set forth below, UIEK fully supports the decision and proposed revisions to the PCS, which it believes are warranted and compelled by the Compact in light of the existence of the CWA Section 303 programs and requirements.

UIEK is a voluntary organization consisting of representatives from the electric generating utilities in the Commonwealth of Kentucky. For more than 20 years, UIEK has provided input to regulatory authorities on key environmental regulatory issues affecting its member companies. This law firm currently serves as legal counsel to UIEK and is submitting the following comments on ORSANCO's proposed amendments to the PCS on UIEK's behalf.

As noted in the initial public notice soliciting comments on potential revisions to the PCS in 2017, a majority of ORSANCO's Ad Hoc Committee members, and a majority of ORSANCO Commission members, favored an expanded version of Alternative 2, which would eliminate Chapters 3 and 4 of the PCS on water criteria and mixing zones, and eliminate portions of Chapter 5 regarding discharge limitations. The proposed revisions that are currently subject to public notice and comment advance those recommendations. Essentially, the PCS revisions will eliminate dual regulation of water quality standards by ORSANCO under the Compact and by the states under the CWA. UIEK believes the proposed revisions to the PCS are warranted and necessary, for the reasons stated below.

A. The Water Quality Standards in the PCS Are No Longer Justified Under the Compact

The 1948 ORSANCO Compact establishes certain limited, baseline treatment requirements for discharges of sewage and industrial wastes and also grants discretion to the Commission to determine if additional treatment standards are needed to protect public health or to preserve the waters for other legitimate purposes. Specifically, the Compact provides in relevant part:

It is recognized by the signatory States that no single standard for the treatment of sewage or industrial wastes is applicable in all parts of the District due to such variable factors as size, flow, location, character, self-purification, and usage of waters within the District. The guiding principle of this Compact shall be that pollution by sewage or industrial wastes originating within a signatory State shall not injuriously affect the various uses of the interstate waters as hereinbefore defined.

Article VI also generally provides for ORSANCO to establish standards that go beyond this basic level of protection of the Ohio River where deemed necessary. For example, Article VI provides:

All industrial wastes discharged or permitted to flow into the aforesaid waters shall be modified or treated, within a time reasonable for the construction of the necessary works, in order to in order to protect the public health or to preserve the waters for other legitimate purposes, including those specified in Article 1, to such degree as may be determined to be necessary by the Commission after investigation, due notice and hearing.

Accordingly, the discretion of ORSANCO to establish additional water quality standards is confined by the requirement to find them to be necessary to protect legitimate uses or public health after notice and hearing.

The PCS related to water quality criteria are no longer necessary in light of the subsequent implementation of the CWA by the states. The states that are members of the Compact have all promulgated water quality standards to fully protect all uses of the Ohio River. For point source dischargers, those standards are implemented through the state-approved NPDES permitting program. The state water quality standards are subject to EPA review and approval, including requirements to demonstrate that any the criteria are sufficiently stringent and include all elements of EPA water quality program requirements, including antidegradation policies.

In light of the CWA Section 303 water quality programs adopted by states, it cannot be shown that additional standards should be maintained by ORSANCO on the grounds they are necessary *further* standards to protect the Ohio River for legitimate uses. In this regard the CWA requirements, including those for triennial reviews of state standards under 40 CFR Part 131, have eliminated the need and any legal justification for the water quality standard components of the PCS. Indeed, the EPA oversight of the state standards was substantially increased though the revisions to 40 CFR Part 131 adopted by EPA in August 2015. Those revisions increased the obligations of states to update water quality criteria during triennial reviews based upon the best available science:

Meaningful and transparent involvement of the public is an important component of triennial review when making decisions about whether and when criteria will be adopted or revised to protect designated uses. The rule provides more clearly defined and transparent requirements, so that states and authorized tribes consider the latest science as reflected in the CWA section 304(a) criteria recommendations, and the public understands the decisions made.

80 Fed. Reg. 51020, 51022 (August 21, 2015). Accordingly, additional ORSANCO water quality standards are no longer justified under the language of the Compact.

B. Maintaining ORSANCO's Water Quality Standards Creates Undue Burdens on the States and Regulated Entities

Apart from a lack of demonstrated regulatory need under the Compact, it would be unreasonable to maintain PCS that are simply duplicative and an unnecessary burden on the states and regulated businesses. Any differences between the PCS and state Clean Water Act standards can also lead to confusion for the states and the regulated community and can create unnecessary complexity in the NPDES permitting processes implemented by the states. A further complication of the duplication between the PCS and state-specific WQS is the fact that there is no consistency among the member states in how they implement the PCS. Some states adopt the PCS by reference, other states adopt the PCS via a formal rulemaking, while others "pick and choose" what elements of the PCS to adopt or simply implement in NPDES permits. This causes confusion for regulated entities that discharge to the Ohio River in terms of what specific WQS will be used to develop permit requirements. The variance process employed by ORSANCO until recently is a prime example of such confusion and unnecessary complications inserted into the NPDES permitting process.

In closing UIEK notes that ORSANCO has a valuable role in meeting the goals of the Compact by continuing its efforts on scientific studies of the Ohio River and research. UIEK appreciates ORSANCO's efforts to revise its PCS to eliminate unnecessary and potentially conflicting standards.

Sincerely,

Jack C. Bender

PSC@orsanco.org

Re: Alternative Recommendations – Pollution Control Standards

To Whom It May Concern:

The following comments are submitted on behalf of FirstEnergy Corp. (FirstEnergy), a diversified energy holding company with both electric distribution and generation companies forming one of the nation's largest investor-owned electric systems, serving customers in Ohio, Pennsylvania, New Jersey, West Virginia, Maryland, and New York. FirstEnergy's generation subsidiaries control over 15,000 megawatts of generating capacity from a diversified mix of scrubbed coal, non-emitting nuclear, natural gas, pumped-storage hydro, and other renewables. As such, FirstEnergy has a vested interest in Ohio River Valley Water Sanitation Commission's (ORSANCO) Pollution Control Standards (PCS) Program.

FirstEnergy participated in the development of and concurs with comments filed by the Ohio Utility Group (OUG¹) in support of the Commission's adoption of Alternative #2, as well as initial comments filed on August 29, 2017 by the Power Industry Advisory Committee (PIAC). In addition, FirstEnergy is pleased to offer the following comments to further emphasize points raised by the OUG.

On June 26, 2018, ORSANCO made available for comment its recommendation to adopt "Alternative 2" of the five alternatives originally proposed for review in 2017. The ORSANCO recommendation to adopt "Alternative 2" would "[m]odify ORSANCO's Pollution Control Standards ... by removal of the Water Quality Criteria (Chapter 3), Mixing Zone Designation (Chapter 4) and portions of wastewater discharge requirements (Chapter 5) from the [Pollution

Control Standards] and maintain the Chapters on Designated Uses.” At the June 7, 2018 Commissioner’s meeting, the Commissioners voted to proceed with the adoption of Alternative 2. FirstEnergy agrees with adopting proposed Alternative 2 and supports ORSANCO’s recommendation.

[1] The member companies include: AEP Generation Resources Inc., Buckeye Power, Inc., The Dayton Power and Light Company, Duke Energy Ohio, Dynegy Commercial Asset Management, LLC, FirstEnergy Solutions, and Ohio Valley Electric Corporation.

PCS Comments

Page 2

August 17, 2018

Of the five alternatives originally proposed by the Commission, FirstEnergy supports the adoption of Alternative #2 as the most sensible, cost-effective approach to satisfying the goals of the ORSANCO Compact. As noted in the Commission’s materials and in the comments of several Advisory Committees, ORSANCO was created in 1948, at a time when the need for water quality improvements in the Ohio River was clear and the absence of an effective regulatory framework to address that need was critical.

Since that time, the federal Clean Water Act and related laws have been enacted, as well as the development and implementation of a comprehensive system of federal and state water quality programs and standards, which administer the CWA for all ORSANCO Compact States. The result has been a dramatic improvement in the quality of the Ohio River, as well as its tributaries and other streams throughout the Compact States.

Today, each of the Compact States is implementing a federally-enforceable water quality program approved by the U.S. Environmental Protection Agency (US-EPA) pursuant to the Clean Water Act. Those programs have been effective in addressing each State’s streams as aquatic habitats, as well as supporting their uses for recreation and drinking water.

Under Alternative 2, ORSANCO would no longer conduct a triennial review of their Pollution Control Standards or assess variances for the Ohio River. However, under the Clean Water Act, each Compact state is required to develop and enforce water quality standards; requirements which must be approved by the U.S. EPA. In addition, most of the standards promulgated by the states come directly from U.S. EPA recommendations. Thus, should ORSANCO adopt Alternative 2, contrary to the concerns expressed by some commenters, water quality of the Ohio River will continue to be protected by the Compact states, with input and oversight from the U.S. EPA. Further, as noted above, ORSANCO would maintain the chapters on Designated Uses and presumably continue to submit an Integrated Report on these uses for the entire Ohio River.

Rather than trying to be a regulatory body that duplicates the work of the states, FirstEnergy contends that, by adopting Alternative 2, ORSANCO can focus on one of its greatest assets to the states – collecting data on the health of the Ohio River. This is a very important aspect of developing water quality standards and is especially critical given the limited resources both states and ORSANCO have faced in the most recent years.

Whereas the ORSANCO PCS may have been necessary when the Compact was first signed 70-years ago, they have since become duplicative of the subsequently enacted federal and state water quality

programs established under the Clean Water Act. Today, the water quality goals of the Compact states are being effectively addressed by the Clean Water Act, while ORSANCO's PCS provide little or

PCS Comments
Page 3
August 17, 2018

no added value. In fact, the differences between the PCS and Clean Water Act standards can lead to confusion for the States and the regulated community, and can create complications in the permitting process, where there is often no effective way to question or challenge the appropriateness or applicability of the underlying PCS in specific permitting situations.

FirstEnergy appreciates the historical role ORSANCO has provided in protecting and preserving water quality in the Ohio River and in collecting and disseminating river water quality data and information. Furthermore, we appreciate the opportunity to provide these comments on the adoption of proposed Alternative 2 for the PCS Program and request the Commission carefully consider these comments, as well as those from OUG. Please do not hesitate to call me at (724) 838 - 6099 to discuss these comments in more detail.

Sincerely,

Re: Supplemental Comments on PCS

These comments supplement my comments sent on August 12, 2018. As stated, I oppose and object to the proposed changes to the Pollution Control Standards (PCS) and ask that ORSANCO retain the language passed in 2015. I have little hope however, that in this instance ORSANCO will listen to the will of the people, drinking water utilities and conservation organizations. It is because I believe the Commission has already made up its mind to proceed with emasculating the Pollution Control Standards (PCS) that I submit the following to supplement my earlier comments.

If ORSANCO does proceed and strips the Ohio River of the existing standards, it must do so in an orderly manner in order to allow the states time to conduct the rulemaking that will be necessary in several of the states to compensate for the loss of the current standards. Additional language to the effect that the current PCS remain in effect until a state conducts rulemaking, adopts standards and receives USEPA approval for the changes should be added to be certain the changes do not impact the river our communities or the states in unintended ways.

Subject: Proposed Changes to Pollution Control Standards
Date: Sunday, August 19, 2018 3:14:41 PM

Dear ORSANCO Commissioners

I am writing this email to object to the proposed changes to Pollution Control Standards that ORSANCO currently sets as part of the Compact. By voting to stop development of these standards, ORSANCO is significantly limiting the goals and objectives this group is charged with meeting through the Compact.

ORSANCO has served as a mediator to bring the 8 Compact states together to implement critical water pollution control programs in the Ohio Valley. Stripping away the function of developing pollution control standards reduces this groups authority, raising the question of why ORSANCO should continue to exist.

Since its inception in 1948, ORSANCO has played a key role in cleaning the Ohio River and has raised pollution control standards. In its present configuration, ORSANCO will continue to bring water quality issues to the forefront. Voting to reduce ORSANCOs role would be a mistake.

As a member of ORSANCOs Public Information Advisory Committee, I want to bring to the attention of the Commissioners that PIACO voted unanimously in our opposition to changing ORSANCOs critical role in the development of Pollution Control Standards. Our message was clear and I ask the Commissioners not to change their duty to bring the Compact states together in the area of improving water quality on the Ohio River.

Dear Mr. Harrison,

The Commonwealth of Pennsylvania welcomes the opportunity to provide comments on the proposed changes to ORSANCO's Pollution Control Standards (PCS) Program. Since 1948, the Commonwealth has partnered under the ORSANCO compact with the other basin states and the federal government to cooperatively manage the water resources of the Ohio River Watershed. Through the authority of the Federal Clean Water Act (CWA), the states have the responsibility to set and implement water quality standards. However, in addition to this authority, Pennsylvania recognizes the critical importance and authority of interstate commissions such as ORSANCO in the cooperative management of interstate river systems. While much has changed since the signing of the Compact and the subsequent passage of the CWA, significant water quality issues remain. While the mainstem of the Ohio River is attaining uses related to aquatic life throughout its length, it is impaired for both uses of contact recreation and fish consumption along much of its length. These issues highlight the continued need for cooperative management related to water quality between the signatories.

Management of interstate waters is complex. Interstate waters management decisions, such as those related to impairment/attainment of designated uses, limits for National Pollution Discharge Elimination System (NPDES) permits, and setting of wasteload allocations in TMDLs, all benefit from standardized criteria and approaches. This provides certainty and equity for the regulated community and the public throughout the basin. However, Pennsylvania recognizes that states have different regulatory and legislative processes that, in some cases, have resulted in the lack of direct incorporation of ORSANCO's PCSs into state water quality standards. As a result, some PCSs are duplicative of state standards. Pennsylvania recognizes that this creates an undue regulatory burden for the dischargers to the Ohio River and that efforts to address this duplication should be of top priority to the Commission and its member states. Pennsylvania is concerned, however, that the proposed changes to the program, as shown in the redline version of the proposed PCS program rules, are far-reaching in scope. At a minimum, certain useful pieces of the 2015 version of the PCS program should be retained. To that end, Pennsylvania submits the following comments regarding specific pieces of the draft PCS proposal:

- 1) Pennsylvania requests that the PCS program be modified to retain the signage/marker requirements for discharge outfalls contained in the current Chapter 5.1(B). In Pennsylvania, signage is limited to combined sewer overflows; this ORSANCO requirement is helpful in that it expands those requirements to other types of discharges. The markers make it possible for the public to report any unusual occurrences and prevent public contact with the outfalls for public safety purposes.
- 2) Pennsylvania requests that the PCS program be modified to retain the 110-degree maximum temperature requirement for direct discharges that are accessible to the public as is contained in the current Chapter 3.3F related to human health protection and in the water quality criteria table in Chapter 3.1. In Pennsylvania, this is not a regulatory requirement but rather contained in guidance. Retention of this requirement will provide additional protection to the public to prevent scalding when humans come in contact with the surface water.

Other states and/or commissioners/proxies may feel similarly that portions of the proposed redline version of the PCS program should be retained. For that reason, Pennsylvania supports an approach similar, but not identical to, Alternative 4 which would allow for a deeper investigation of the PCS program with recommendations for changes utilizing a more methodical approach while addressing concerns and needs of all signatory states.

While the number of permits which discharge to the Ohio River directly in Pennsylvania is not large, the workload associated with the modification of the PCS program as it relates to the water quality standards and permitting cannot be comprehensively determined. Because Pennsylvania incorporates ORSANCO PCSs into its regulatory code at 25 Pa. Code §§ 93.9(b) and 93.9w, a rulemaking to modify the regulations will be necessary if ORSANCO eliminates PCSs. Based on a comparison between ORSANCO PCSs and Pennsylvania's statewide water quality standards (WQSs), 16 PCSs were both found to be not duplicated and more stringent than Pennsylvania's WQSs. For at least five of those parameters, ORSANCO appears to have adopted the U.S. Environmental Protection Agency's national recommendations for human health criteria: barium, copper, methylmercury and mercury (based on methyl), selenium and zinc. In addition to rulemaking to address the removal of PCSs, permits may be subject to antibacksliding protections. These permits will need to be evaluated on a permit-by-permit basis to determine if changes and demonstrations of comparable water quality protection must be made based on the elimination of the PCSs.

Before final action by the ORSANCO commissioners and proxies related to the modification of the PCS program, Pennsylvania requests that ORSANCO provide a demonstration of how designated uses of the Ohio River will be protected should the PCSs be removed and provide an analysis of permits that may be subject to modification and/or impacted by antibacksliding provisions along the length of the Ohio River. If Alternative 2 is adopted, it is likely that the removal of the PCSs by ORSANCO may precede any rulemaking by Pennsylvania. As a result, Pennsylvania will continue to apply, as appropriate, the PCSs that are incorporated into the state water quality standards. Rather than making any changes to the PCSs that are effective immediately, Pennsylvania requests that ORSANCO provide an appropriate timeline to allow states to make any necessary regulatory changes should Alternative 2 be adopted.

Regardless of the outcome of ORSANCO's decision regarding the future of the PCS program, Pennsylvania will continue to work with the other signatory parties in the cooperative management of the water resources of the Ohio River Watershed.

Sincerely,

A handwritten signature in black ink, appearing to read 'Patrick McDonnell', written in a cursive style.

ATTN: PCS Comments

To Whom It May Concern:

I am writing on behalf of the City of Evansville expressing opposition to the proposal of eliminating pollution control standards for the Ohio River. Frankly, ORSANCO has provided invaluable support to the Evansville Water and Sewer Utility relating to water quality for several decades. The citizens of Evansville are grateful for that support.

ORSANCO has the unique role of ensuring that all states (and polluters) in the Ohio River watershed are held to the same standards. It seems that the elimination of water quality criteria developed for the Ohio River by ORSANCO could well be detrimental to the river, and the watershed as a whole.

I understand that one of the reasons cited for the consideration of discontinuing the triennial review process of updating the PCS rules is to eliminate redundancies that overlap with federal and state regulations. I find it interesting, however, that there are more than 180 instances where ORSANCO's rules are not redundant to state and federal regulations.

As mayor, there is nothing more frustrating than dealing with conflicting or duplicative federal regulation. However, we believe that the standards in place do not constitute an unnecessary regulatory burden, and rather provide certainty for regulated entities along the length of the Ohio River, while also providing protection of designated uses.

In addition to providing drinking water to 5 million people, the Ohio River is known as a "working river" because of the hundreds of industrial and wastewater treatment plants along its 981-mile route. Evansville is located at Ohio River mile marker 791, well downstream from the river's origin. Therefore, upstream water quality is very important to our city. The Ohio River is an amazing asset for Evansville. It serves as our water source, but also as a vital recreational venue and picturesque front door. Eliminating ORSANCO regulations could be a negative game changer for our community.

The City of Evansville recommends and encourages ORSANCO to continue to oversee Ohio River Pollution Control Standards to ensure the highest water quality possible.

Thank you for your thoughtful consideration.

Sincerely,

A handwritten signature in black ink, appearing to read "Lloyd Winnecke". The signature is fluid and cursive, with a large initial "L" and "W".

Lloyd Winnecke, Mayor

RE: Pollution Control Standards

Dear Commissioners,

The Sierra Club Miami Group joins countless other organizations in commenting on the Ohio River Valley Water Sanitation Commission's (ORSANCO) 2018 review of your Pollution Control Standards. As water quality is under attack nationwide, some Commissioners apparently support withdrawing from your role in maintaining, administering and periodically updating the current Pollution Control Standards. We strongly oppose that proposal.

The Miami Group serves thousands of members in southwest Ohio, and we use the Ohio River and its tributaries for drinking water, scientific study and recreation. We note that ORSANCO is a party to the Metropolitan Sewer District consent decree and has a responsibility to ensure that water quality standards are not weakened and do not adversely impact the stormwater and sanitary sewer systems.

ORSANCO has operated programs to protect and improve water quality in the Ohio River Basin for nearly 70 years, and is considered necessary because: "The control of future pollution and the abatement of existing pollution in the waters of said basin are of prime importance to the people thereof, and can best be accomplished through the cooperation of the States situated therein, by and through a joint or common agency."

Your own staff have crunched the numbers and identified nearly 200 individual pollution control standards, including the critically important ban on chemical discharge "mixing zones," that would not exist without ORSANCO. Your Commission plays a key role in protecting our fresh waters.

Please do not abdicate that role and bow to industry pressure. Protect drinking water for millions of people, and let's continue to improve the Ohio River for the enjoyment of all.

Sincerely,

Marilyn Wall
Miami Group Chair

Re: Alternative Recommendations – Pollution Control Standards
Our File No. 108630

To Whom It May Concern:

On June 26, 2018, ORSANCO made available for comment its recommendation to adopt “Alternative 2” of the five proposed alternatives originally proposed in 2017. The following comments regarding this action are submitted on behalf of the Ohio Utility Group and its member companies (“OUG” or “the Utilities”),¹ which is an association of individual electric utilities in the State of Ohio. The Utilities own and operate power plants and other facilities that generate, transmit, and distribute electricity for residential, commercial, industrial, and institutional customers. These power plants and other facilities are subject to the Clean Water Act and Ohio water regulations. OUG’s purpose, in part, is to participate collectively on behalf of its members in administrative proceedings under various environmental laws and in litigation arising from those proceedings that affect the Utilities.

In 2017, ORSANCO solicited comments from its Advisory Committees regarding five alternatives to address its role in developing the Pollution Control Standards (“PCS”) for the Ohio River. These alternatives ranged from continuing with the status quo to completely eliminating ORSANCO’s role in developing the standards. On August 29, 2017, the Power Industry Advisory Committee submitted comments to ORSANCO. *See*, attached Comments. The Utilities endorse these comments, having provided input on the initial comments. The Utilities further incorporate these comments by reference.

In early 2018, ORSANCO ultimately expressed its intent to adopt Alternative 2, which was the Power Industry Advisory Committee’s preference. This would “[m]odify ORSANCO’s

¹ The member companies include: AEP Generation Resources Inc., Buckeye Power, Inc., The Dayton Power and Light Company, Duke Energy Ohio, Dynege Commercial Asset Management, LLC, FirstEnergy Solutions, and Ohio Valley Electric Corporation.

Pollution Control Standards ... by removal of the Water Quality Criteria (Chapter 3), Mixing Zone Designation (Chapter 4) and portions of wastewater discharge requirements (Chapter 5) from the [Pollution Control Standards] and maintain the Chapters on Designated Uses.”² At the June 7, 2018 Commissioner’s meeting, the Commissioners voted to proceed with the adoption of Alternative 2. The Utilities are comfortable with this proposed alternative and support ORSANCO’s recommendation.

At the Technical Committee meeting on February 7-8, 2018, some members of the public and some States expressed concerns that this action would be to the detriment of the Ohio River. This sentiment was reiterated in hundreds of non-substantive comments submitted by the public. As stated previously, this could not be further from the truth. Most of these comments appear to be due to a lack of understanding of how Ohio River water quality is protected. The Compact was signed on June 30, 1948. At that time, the U.S. EPA and state agencies to regulate water pollution did not exist and there was a need to address the increasing raw sewage and unregulated industrial pollution discharged to the Ohio River. Since that time, the Clean Water Act was enacted (and revised multiple times) and has been implemented at both the State and Federal level.

Under Alternative 2, ORSANCO will no longer conduct a triennial review of the PCS or assess variances for the Ohio River. However, under the Clean Water Act, each state is required to develop and enforce water quality standards; these requirements must be approved by U.S. EPA. In addition, most of the numeric criteria promulgated by the states come directly from U.S. EPA recommendations. Thus, should ORSANCO adopt Alternative 2, contrary to the concerns expressed by some, the Ohio River will continue to be protected by the states, with oversight and input from U.S. EPA. Further, as noted above, ORSANCO would maintain the chapters on Designated Uses and presumably continue to submit an Integrated Report on these uses for the entire Ohio River.

It should be noted that Ohio EPA cannot incorporate ORSANCO’s PCS by reference nor can it include any of ORSANCO’s PCS in a permit without first promulgating, through notice and comment rulemaking, the standards under Ohio Law.³ Therefore, any changes to ORSANCO’s PCS must then be adopted by Ohio EPA through a rulemaking, which requires Ohio EPA to provide its own legal and technical justification for the revisions before the revised standards can be implemented on the Ohio River. This step, however, allows interested parties to challenge any proposed standards when there is no defensible legal or technical basis for the standards. By adopting Alternative 2, ORSANCO is simply removing one component of an already long process in promulgating and implementing regulations to protect the Ohio River.

The Utilities would also like to point out that, currently, there is no consistency among member states in implementing the PCS. Some states adopt the PCS by reference, some states “pick and choose” what PCS elements are adopted, while others (such as Ohio EPA) are required to conduct a formal state rulemaking to adopt any elements of the PCS. This confusion is detrimental

² <http://www.orsanco.org/wp-content/uploads/2016/09/Preferred-Expanded-Alternative-2-and-Minority-Report.pdf>

³ See, *The Dayton Power and Light Company v. Nally*, ERAC Case Nos. 13-296712-13-666718 (June 18, 2014); R.C. §119.

to the regulated community as the advantage of having regulatory certainty (in terms of permit requirements) is often unavailable.

The Utilities have long questioned the jurisdiction for challenging ORSANCO's ability to promulgate the Pollution Control Standards. Article VI of the Compact gives the Commission authority "to adopt, prescribe and promulgate rules, regulations and standards for administering and enforcing the provisions of this article." The Compact also gives the Commission authority to issue orders requiring a person to eliminate, modify, or treat a discharge into the Ohio River. Article IX also indicates that the Commission can enforce these orders in any Court of General jurisdiction or any United States district court in the signatory states "by mandamus, injunction, specific performance or other form of remedy." Ohio R.C. §6113.03 provides that the courts of common pleas are granted the jurisdiction specified in Article IX. In contrast, the Compact is silent regarding whether a party has a right to appeal ORSANCO's Pollution Control Standards, and ORSANCO's legal staff contends that parties are not afforded judicial review. Thus, the Utilities have often found it frustrating when ORSANCO proposed revisions where there was no sound legal or technical basis for the revision. Even when the Utilities had the opportunity to comment on ORSANCO's revisions, there was no legal recourse if ORSANCO disregarded the Utilities' comments. In contrast, as noted above, when states promulgate standards, there is a legal avenue to challenge those standards.

Rather than trying to be a regulatory body that duplicates the work of the states, the Utilities think that, by adopting Alternative 2, ORSANCO can focus on one of its greatest assets to the states – collecting data on the health of the Ohio River. This is a very important aspect of developing water quality standards. This is especially critical given the limited resources both states and ORSANCO have faced in the most recent years. Many OUG companies rely on ORSANCO monitoring data to assess water quality near their generating facilities.

The Utilities thank ORSANCO for the opportunity to comment and would be happy to meet with Ohio EPA to discuss the above recommendations.

Very truly yours,

Cheri A. Budzynski

Comments of the Power Industry Advisory Committee on Proposed Alternatives to how ORSANCO Implements the Pollution Control Standards (PCS) Program

August 2017

These comments are provided by the ORSANCO Power Industry Advisory Committee (PIAC) concerning proposed alternatives as to how ORSANCO implements the existing Pollution Control Standards (PCS), as delineated in the July 18, 2017 white paper. We appreciate the time and resources that the Ad Hoc Committee has taken to develop the five proposed alternatives. Good water quality in the Ohio River benefits everyone, and the significant chemical and biological monitoring programs conducted by ORSANCO staff have clearly shown improved water quality. In addition, several companies of the PIAC have contributed meaningful funding to ecological assessments of the Ohio River near coal-fired generating facilities for over 30 years via the Ohio River Ecological Research Program. These studies, like the ORSANCO data, have demonstrated improved water quality since the early 1970s.

With the advent of potential lowered funding to ORSANCO (and also to states) from the federal government, the decision to re-think the function of the PCS is timely. Notwithstanding the fact that the ORSANCO Compact does not directly address the derivation and implementation of water quality standards (WQS), ORSANCO's greatest contribution for all stakeholders is the collection and issuance of high-quality monitoring results. Many PIAC companies have accessed these data to support environmental permitting/relicensing activities.

As to the alternatives outlined in the white paper, the PIAC can support alternatives 1, 2, or 5. Alternative 2 would be our preference. One of the reasons we believe that ORSANCO should not assume the review of WQS during its triennial reviews is that the Commission has no mechanism for due process (i.e., affected parties cannot file legal challenges to updated or new standards). This is a critical aspect when states propose new environmental regulations or standards. Moreover, the effort that ORSANCO staff put toward the triennial review process is not cost-effective as some member states, themselves, do not adopt the updated PCS in their own standards. The PIAC thinks ORSANCO would be better served reallocating the limited resources to programs supporting data collection on the Ohio River. As each member state has the authority to implement the Clean Water Act, the added value of the states working with ORSANCO during the triennial review process is highly speculative. ORSANCO could still serve in an advisory role should the state need assistance in the development of their WQS. This is not to say that the PCS are outdated or irrelevant; as an example, ORSANCO is one of only a few water resource regulatory bodies that has adopted US EPA's methylmercury fish tissue

criterion. The PIAC supports ORSANCO's usage of a weight-of-evidence approach to assess the fish consumption use, and we support the continued use of this for 305(b) reporting purposes.

The electric utility industry is a highly regulated sector. Significant investments have been made by PIAC member companies to reduce air emissions, minimize solid waste releases, and improve the quality of process waste streams. The footprint of coal-based power production on the Ohio River is considerably less than 10 years ago. For those facilities that have installed state-of-the-art pollution control technologies to comply with applicable federal or state regulations (allowing them to continue to use coal as a fuel), the development of reasonable, scientifically-based environmental standards is essential.

Lastly, the Utilities would like to bring attention to some statements made concerning Alternative 3. Under the "Key Considerations", item #6 states that one of the advantages of this alternative would be to "Reduce the influence of campaign donors and special interest groups on the standards development and permitting processes." One of the disadvantages (cons) listed, as item #1, is that the alternative may be "Opposed by some industries and the chamber of commerce who object to any regulations, even the ones that may help them." We consider these statements irrelevant, without basis, and inflammatory. Over the years the PIAC and other industry advisory committees have worked constructively with ORSANCO and member states to develop standards and policies that are reasonable and technically sound.

The PIAC appreciates the opportunity to submit these comments.

Ohio Chapter

RE: Pollution Control Standards

Dear Commissioners,

The Sierra Club Ohio Chapter submits these comments regarding the Ohio River Valley Water Sanitation Commission's (ORSANCO's) Pollution Control Standards on behalf of our more than 22,000 members and in addition to the coalition letters that we have signed onto. Our members use the Ohio River and its tributaries for recreation, scientific research and, along with millions of others, as a source of drinking water.

The Ohio Chapter stands with our Hoosier Chapter in Indiana, our Cumberland Chapter in Kentucky, our Chapters in the five other ORSANCO member states, and with countless other organizations and individuals who urge you to maintain the pollution control standards that have, in various capacities, benefited water users and aquatic ecosystems in the Ohio River Valley for more than 70 years.

We are adamantly opposed to any attempts to weaken or eliminate those standards. Accordingly, we are asking you to reject proposed Alternative 2, which represents an arbitrary abdication of your appointed duties, and instead support some iteration of Alternatives 3 and 4, which call on ORSANCO to maintain and improve upon your pollution control standards program.

ORSANCO was created in 1948, because: "The control of future pollution and the abatement of existing pollution in the waters of said basin are of prime importance to the people thereof, and can best be accomplished through the cooperation of the States situated therein, by and through a joint or common agency."

In the same year that ORSANCO was created, Congress also established the Federal Water Pollution Control Act, which is of course the precursor to our modern Clean Water Act. Section 101(a)(1) of the Clean Water Act states that “it is the national goal that the discharge of pollutants into the navigable waters be eliminated by 1985.”

It is 2018; the Ohio River is “navigable” to every physical, legal and practicable extent; and yet the River’s chemical, physical and biological integrity remain threatened on a daily basis by the intentional discharge of harmful pollutants into our public waterways.

Over the decades, ORSANCO has worked with the states and the federal government to protect the Ohio River for millions of people, and while pollution has not been eliminated in the Ohio River, it is cleaner now than it would be without the protection of ORSANCO’s pollution control standards.

Congress understood that no one entity, even the federal Environmental Protection Agency, can adequately protect and preserve our nation’s water quality by rowing alone. The Clean Water Act is implemented by the states but requires a network of partners to function. For example, that is why the Act includes a “citizen suit” provision, and why cooperation between jurisdictions is an essential component of the law.

It is telling that a vast majority - if not all - water users, such as public utilities and responsible farmers, support maintaining ORSANCO’s existing regulatory program, and they agree that your work is not redundant. It is necessary, and it is cost effective.

The Ohio River is a vital resource to the people of Ohio, Kentucky, Indiana and our fellow member states. Please do all that you can to protect it.

Sincerely,

Nathan G. Alley
Ohio Chapter Conservation Program Coordinator

ORSANCO Pollution Control Standards
5735 Kellogg Avenue
Cincinnati, OH. 45230

Re: PCS Comments

To whom it may concern:

Please accept these comments on behalf of Valley Watch, Inc., an Evansville, IN based not for profit whose purpose is “to protect the public health and environment of the lower Ohio River Valley.” We are also signing on to more technical and legal comments by at least one other party.

First, as an organization that has its very roots tied to the Ohio River, we feel betrayed by this attempt to virtually eliminate ORSANCO’s pollution control standards for the River from which most of our members drink and recreate. At no time during the seventy year history of ORSANCO have the Commissioners been so brazen as to seek to undo the very reason ORSANCO exists. Your reason for being is addressed on the “home page of your website, *“Since 1948, ORSANCO and its member states have cooperated to improve water quality in the Ohio River Basin, ensuring the River can be used for drinking, industrial supplies and recreational purposes; and can support a healthy and diverse aquatic community. ORSANCO operates monitoring programs to check for pollutants and toxins that may interfere with specific uses of the River.”*

Since the passage of the Clean Water and Safe Drinking Water Acts, the River, our River has made steady improvement in overall water quality as witnessed by greater variety of native and unfortunately non native species of aquatic life and increase recreational use by both boaters and fishermen. During that same period monitoring improvements have been able to catch both accidental and intentional spills of dangerous chemicals that has served to protect humans and wildlife on the River. We certainly applaud those advances and admonish ORSANCO to keep up the improvements.

Redundancy with state rules.

It seems that many Commissioners, especially from some of the most polluting states want to make the case that ORSANCO’s PCS are unnecessary because every state has its own standards already and that USEPA oversees all those. If all the State standards were equal in their protection levels and covered all the chemicals covered by ORSANCO, that might be a decent argument. However, not all states have equally protective standards and some states seem inclined to allow far more pollution into the River than others. For us, toward the end of the River, at Mile 600 on, dropping the common ORSANCO standards would make us wholly dependent on the whims of upriver enforcement and sometimes political decisions that are neither protective nor adequate.

In Evansville, for instance, we are forced to drink water that may have originated from rainfall in West Virginia that picked up planned and unplanned pollutants from not only West Virginia but also from Pennsylvania, Ohio, Kentucky and Indiana. Are we simply supposed to "hope" that the environmental protection agencies in those states take their job seriously and are dedicated to protecting our water and not following the whims of political forces in those states? Experience tells us otherwise, as way too often, states upriver may allow increased levels of various pollutants that would not be allowed by the ORSANCO PCS.

A simple look at Indiana alone, for instance, shows there are sixty-three chemicals where the numeric standard for Indiana is weaker than the numeric standard set by ORSANCO. Additionally, fifty-seven Chemicals in the ORSANCO PCS do not even exist in Indiana PCS. That is a total of 120 different chemicals that Indiana has weaker or non-existent standards.

The same thing happens in Kentucky which has fifty-two chemicals with standards weaker than those of ORSANCO and seventeen that ORSANCO PCS has that are not covered by Kentucky's PCS.

These two states alone show sufficient proof that the ORSANCO PCS are NOT "redundant." To use that argument is specious and dangerous for people who live in the lower reaches of the entire watershed.

Common Bonds

The Ohio River is both a boundary and a common bond that cannot be escaped. What happens up River impact the quality of the River down River. What happens on one side of the River impacts the quality of the other side of the River. How on earth can one state divided from the other with this common bond decide that a higher level of pollution is allowed that will impact the health of citizens on the other side. A common set of PCS is the only thing that prevents such a scenario from occurring.

Anti-Backsliding in Clean Water Act Amendments of 1987

It was clearly Congress' intent when it added Sections 402(o) and 303(b)(4) to the Clean Water Act that "backsliding" of standards is prohibited. Although, compacts like ORSANCO were not specifically referenced in those amendments, the intent was to make sure that water quality kept improving and NOT deteriorating.

The current PCS proposal is a morbid example of backsliding since many chemicals listed in the ORSANCO PCS are not even considered in many state programs for the slightest regulation or restriction.

Those sections of the Clean Water Act, promulgated as 40 CFR 122.44[1] and 122.62[a], alone should negate any further effort to eliminate ORSANCO's own PCS and, in fact, should be used to always strive to improve those common waters that ORSANCO is chartered to protect.

Recreational Use of the River

Valley Watch formed in 1981 due, in part, to an acquired love of the River by its current president, John Blair. At that time, the River was too often treated as little more than a sewer for the disposal of all kinds of chemical and organic waste from both industries and municipalities. But as private organizations like Valley Watch and public agencies like EPA and ORSANCO became increasingly more protective and vigilant of this wonderful natural resource, additional laws and regulations were designed to improve water quality.

As a result of this private/public partnership, water quality steadily improved to the point that increasing numbers of people are now using the River as a primary source of recreation. The current proposal to eliminate ORSANCO's PCS will not only degrade water quality but will also reduce the Ohio River's use as a recreational venue, including boating, swimming and fishing.

Traveling the length of the River by boat and ground transport, it is evident all along its nearly thousand mile length that people use the River not only for subsistence fishing but also as a place of solace, and party.

Just last week, for instance, more than one hundred extended boating families gathered just north of Dutch Island for a get together called Aquapaloosa. There, about 500 people had fun wading, relaxing on floats, catching up with friends and listening to provided music on their boats and in the shallows of Dutch Island.

The previous week, regional boaters conducted what was called a "Poker Run" which was a fund raising event that collected over \$5,000 for a local charity. Those events will be jeopardized by the elimination of the current PCS from ORSANCO since the absence of those standards will make people fearful of entering the water in order to not get sick.

After the 1937 Great Flood, many River communities not only walled themselves off from the River to protect them from future flooding, they also abandoned the River recreationally for reasons unknown. But the late 20th and early 21st Century has changed all that as Riverside communities has now embraced the River as a destination where people can exercise on its numerous trails or just sit and think or watch a sunrise or sunset unlike any others.

Eliminating water quality standards will have a negative impact on those riverside activities as well due to possible odors or fear of getting contaminated water on their person or especially on their children.

Of course, when that happens, as it surely will, any commerce on the River or at its side will also be reduced, perhaps even to the point that businesses that cater to recreational prospects may be forced out of business. Marinas, Riverside restaurants, museum boats, like Evansville LST 325 are likely to be impacted at the margin if not in total.

Our River is not owned by industry, it is commonwealth

From time to time, Valley Watch has observed a tendency for the River to be considered as nothing more than a conduit to serve the needs of industrial commerce and disposal. Ignored are the beautiful beaches, and sandbars that attract boaters for at least six months of every year. It is more than a staging place for huge barges and towboats to conduct their business.

Yes, numerous ports along the River do encourage commerce on an industrial scale, but for most who love the River, Commerce is a distant consideration that means little or nothing to watching the River flow by whether on it or at its side. Throughout the ages, large populations have been drawn to water and the Ohio River is one of the most important water bodies on Earth.

It acts as a vein in the organ that is our planet. It brings us sustenance, and takes away our waste. Sadly, it has been abused for centuries in a manner that failed to respect its beauty and its magnitude, But just recently, it has begun to gain that respect back. The passage of ORSANCO's Pollution Control Standards has played a significant role in altering that paradigm. Individual states are incapable of recognizing its more esoteric values since it is only a "border" to all but Pennsylvania.

Even, EPA treats it as a border separating Regions 3, 4 and 5 to the point that there are no common regulations on one of the most important ecosystems in our country, indeed the world. ORSANCO has filled that void and that was the real purpose ORSANCO was set up to begin with. Congress in 1948 understood the value of treating the entire River as a single ecosystem and authorized ORSANCO to treat the entire Ohio River watershed accordingly.

Expedient, politically motivated efforts to change that should not be allowed at this time or at any time in the future. Unfortunately, we at Valley Watch are convinced that this is a not so veiled effort to allow the River, our River to once again be reduced to being little more than a sewer for the disposal of industry's waste. If that happens, lots of negative policies will certainly follow and real people will be negatively impacted, not only on the Ohio River and its watershed but also the Mississippi River and the Gulf of Mexico, where already an area the size of Rhode Island is considered a "dead zone" due to activities that began on farms and industrial cities in Indiana, and Ohio, etc.

Please do not allow this degradation to happen.

Sincerely,

John Blair
President

Subject: Pollution standards
Date: Monday, August 20, 2018 9:15:09 AM

Dear Sir: Any downgrading or elimination of pollution standards is unnecessary and unpopular. As a former PIACO member, City Councilmember in Evansville and State Representative, I find this direction dangerous. People will suffer as a result.

If ORSANCO is thinking the State will pick up the challenge, it won't happen - it can't. The very reason for the compact was the necessity of states to work together since the river travelled across borders.

Also, you will find Indiana the worst in environmental protection policy.

As an ORSANCO member, I hold you all morally responsible for your decisions.

Subject: Comments on ORSANCO's proposed changes to PCS
Date: Monday, August 20, 2018 9:47:18 AM

Dear ORSANCO Commissioners,

The Banklick Watershed Council would like to provide comments on the proposed changes to ORSANCO's Pollution Control Standards (PCS) program. The Banklick Watershed is the largest watershed in Kenton County, KY and a subwatershed of the Licking and Ohio Rivers.

We understand and appreciate ORSANCO's responsibility in determining how to best utilize limited resources, especially when staffing levels are down to 20 from 30 in 1976. At the same time, we understand and appreciate that resources at the state level and EPA are also having to be prioritized, which is why ORSANCO's PCS are as vital as ever.

The Banklick Watershed Council agrees with the concerns expressed in the *Minority Report of Commissioners* regarding the majority's preference for Alternative #2, which would rollback ORSANCO's Pollution Control Standards.

We believe there is value in ORSANCO's PCS as they are specific to the main stem of the Ohio River and provide for consistent policies and implementation among the states in the basin. Furthermore, the PCS are not redundant, as there are at least 188 parameters among the states and EPA for which ORSANCO has criteria but the states or EPA does not.

We also believe there is value in ORSANCO being a federally-sanctioned compact that is somewhat insulated from political dynamics of the individual states. As the sole entity overseeing the entire Ohio River Basin watershed, ORSANCO's PCS provide consistency, uniformity, and are uniquely positioned to address needs specific to the Ohio River using sound science and data-driven policy.

The importance of ORSANCO's PCS is highlighted in the summary document (*Review of ORSANCO Pollution Control Standards*) when it cites the *1975 Study of Prospective Water Pollution Control Activities For The Ohio River Valley Water Sanitation Commission* with respect to stream standards that recommends:

- *ORSANCO should work with the states in developing consistent stream standards for the main stem and tributaries having significant impacts on the main stem; and in periodic review of the standards. Its interest should be primarily in achieving interstate compatibility and equity.*
- *Each state formulates stream standards for its own purposes and also for submission to EPA. However, the emphasis of each state is necessarily on its particular*

waters both in and out of the Ohio Basin. Since the Ohio is a boundary river, and because there are many other relationships as among the several state segments of the river system, the interstate agency should provide the overall view and the comparative analyses needed for coordination, consistency and equity. ORSANCO's stream models will be found useful.

Where the Banklick Watershed Council may differ with the Minority Report is around keeping with the triennial review process as there may be more efficient and effective use of resources to keep the PCS up to date and at the appropriate level.

Please reconsider Alternative #2 as your preferred direction to changing ORSANCO's PCS. We believe it is too drastic, compromising the health and safety of the communities along the Ohio River.

Respectfully,
Banklick Watershed Council Board

Re: 2018 Review of ORSANCO Pollution Control Standards

Dear Commissioners:

FreshWater Accountability Project ("FreshWater") is alarmed that the Commission has moved forward with its extreme proposal to essentially eliminate ORSANCO's critical role in setting, maintaining, reviewing, and revising Pollution Control Standards ("PCS") for the Ohio River. **This decision is in direct opposition to ORSANCO's duties under the Ohio River Valley Water Sanitation Compact (the "Compact"), is not supported by factual analysis, and is nearly certain to result in increased levels of pollution and accumulation of toxins in the Ohio River.**

FreshWater submitted comments during the first round of public review of proposed changes to the PCS on February 24, 2018. These are attached as Exhibit A and incorporated herein. FreshWater restates and affirms the claims made therein for purposes of this round of review.

I. ORSANCO HAS NO FACTUAL BASIS TO SUPPORT ITS PROPOSED REVISION TO THE PCS— WHICH RESULTS IN AN ABROGATION OF THE COMMISSION'S DUTIES UNDER THE COMPACT

To support its proposal to essentially eliminate the PCS, ORSANCO has argued the demonstrably false notion that the PCS are redundant to standards adopted under the Clean Water Act ("CWA"), through Federal regulations and Federally-approved State Implementation Plans ("SIPs"). **ORSANCO's own analysis clearly refutes this premise.** Analysis by ORSANCO staff of 661 standards, attached as Exhibit B and incorporated herein, demonstrates that there are 193 parameters for which ORSANCO has criteria that a state or federal agency

does not, and that there are 251 parameters for which federal or state agency criteria is significantly less stringent than that criteria set by ORSANCO. **This analysis shows that for 38% of the standards evaluated, ORSANCO has a significantly more stringent standard than applicable agency standards, and for 30% of the standards evaluated, ORSANCO has a standard where the agencies have none.**

This analysis alone demonstrates that ORSANCO PCS are not redundant to CWA standards as established by Federal and state agencies. Despite signatory states' responsibility to take a cooperative approach through ORSANCO to control and abate pollution in the Ohio River,¹ the majority of Commissioners did not even find it necessary to evaluate the cooperative value ORSANCO was created to uniquely provide. Instead, ORSANCO provided cursory statements concluding that ORSANCO standards are met or exceeded under CWA standards, providing no evidence to support these conclusions, and in fact providing evidence that demonstrates the PCS are not duplicative. Without an analysis regarding ORSANCO's role in the comprehensive addressing of pollution problems impacting the Ohio River, ORSANCO has not completed the factual analysis required to justify the proposed rule change.

One example of the unique protections provided by ORSANCO's current PCS is ORSANCO's ban on mixing zones for bioaccumulative chemicals of concern ("BCC"), which includes any chemical that accumulates in aquatic organisms and has the potential to cause adverse effects as the result of that accumulation.² Chemicals explicitly named in the mixing zone ban include: Lindane, Hexachlorocyclohexane, alpha-Hexachlorocyclohexane, beta-Hexachlorocyclohexane, delta-Hexachlorocyclohexane, Hexachlorobutadiene, Photomirex, 1,2,4,5-Tetrachlorobenzene, Toxaphene, Pentachlorobenzene, 1,2,3,4-Tetrachlorobenzene, Mirex, Hexachlorobenzene, Chlordane, DDD, DDT, DDE, Octachlorostyrene, PCBs, 2,3,7,8-TCDD, Mercury, and Dieldrin.³

ORSANCO's BCC mixing zone ban is critical to preventing the accumulation of BCCs in the Ohio River because it decreases the amount of bioaccumulative toxins that can be permitted to enter the river. No equivalent ban exists through U.S. EPA agency regulation, and ORSANCO's review of state agency regulation demonstrates that multiple signatory states have no such ban absent the ORSANCO PCS.⁴

Thus, ORSANCO's primary justification for its proposed revision is not supported by factual analysis, and what factual analysis ORSANCO has conducted on the matter suggests the PCS provide hundreds of numeric standards and policies that are not replicated anywhere by CWA standards and policies implemented by state and Federal law.

¹ See Preamble, Article I, VI, VIII, OHIO RIVER VALLEY WATER SANITATION COMPACT (June 30, 1948).

² Ohio River Valley Water Sanitation Commission, Pollution Control Standards (2015), Chapter 4: Mixing Zone Designation, F.4.

³ Ohio River Valley Water Sanitation Commission, Pollution Control Standards (2015), Chapter 4: Mixing Zone Designation, F.6.

⁴ See Implementation of ORSANCO Pollution Control Standards, "Alternative 2" Expanded: "Clean Water Act Alternative to ORSANCO PCS Rule."

II. THE MAGNITUDE OF THE PROPOSED CHANGES AND THE OVERWHELMING PUBLIC OUTCRY AGAINST THE PROPOSAL WARRANT ADDITIONAL HEARINGS IF THE PROPOSAL IS GOING TO BE PURSUED

FreshWater wishes to remind the Commissioners that the Ohio River serves as the drinking water source for approximately 5 million people and that the River continues to face threats by known and emerging contaminants that threaten public health. See e.g. Robert L. Herrick, et al. *Polyfluoroalkyl substance exposure in the Mid-Ohio River Valley, 1991-2012*, 228 ENVIRONMENTAL POLLUTION 50 (2017) (concluding “Mid-Ohio River Valley residents appear to have PFOA, but not other PFAS, serum concentrations above US population levels. **Drinking water from the Ohio River and Ohio River Aquifer, primarily contaminated by industrial discharges 209–666 km upstream, is likely the primary exposure source.** GAC treatment of drinking water mitigates, but does not eliminate, PFOA exposure.”) (attached and incorporated herein as Exhibit C). ORSANCO’s proposed revisions to the PCS would result in the Commission abandoning its duty to control and abate pollution in this important drinking water source using the comprehensive cooperative approach that can only be achieved by this unique interstate agency.

ORSANCO has held *one* public hearing regarding the proposed revision to the PCS, which occurred July 26, 2018 at the Cincinnati Airport in Erlanger, Kentucky. *One* public hearing on a matter that will impact the drinking water source for 5 million people in six different states. **Comments provided at this well-attended hearing were uniformly in support of maintaining or expanding the PCS.**⁵ Likewise, 97% of comments received during the proposal’s first round of review, and *all* comments received from municipal water suppliers, the general public, and environmental advocacy groups, supported maintaining or expanding the PCS.⁷

ORSANCO’s proposal would remove hundreds of standards for which no equivalent standard exists in state or Federal law, and it would significantly reduce hundreds of standards. A change in drinking water source protection of this magnitude should include public hearings throughout the affected area. **If ORSANCO does not abandon this proposal, as it should, ORSANCO should hold public hearings along the Ohio River in order to provide impacted users the opportunity to voice their concerns. These hearings should, at minimum, cover both the upper and lower basins of the Ohio River.** Likewise, the public comment period should be re-noticed and extended to conclude after ORSANCO has held these public hearings.

⁵ (Emphasis added).

⁶ Transcript, Ohio River Valley Water Sanitation Commission Public Hearing, Holiday Inn, Cincinnati Airport, 1717 Airport Exchange Boulevard, Erlanger, Kentucky July 26, 2018, available at <http://www.orsanco.org/wp-content/uploads/2018/08/Public-Hearing-Transcript-July-26-2018.pdf>

⁷ During the first round of public comment, only comments submitted by or on behalf of polluting industries supported the current proposal (which made up only 3% of comments received during the first round of review). **There was no testimony presented at the public hearing in support of the current proposal.**

CONCLUSION

For the reasons stated herein, FreshWater urges ORSANCO to abandon its proposed changes to its Pollution Control Standards. ORSANCO should maintain the PCS—which are essential to maintaining and advancing the goals of the Compact and to protecting the Ohio River.

Re: 2018 Review of ORANSCO Pollution Control Standards

Dear Commissioners:

On behalf of FreshWater Accountability Project, we are submitting comments on the radical changes Ohio River Valley Water Sanitation Commission ("ORSANCO") is considering regarding its Pollution Control Standards ("PCS"). FreshWater Accountability Project ("FreshWater") is a nonprofit organization with a mission to preserve and protect freshwater supplies through education and community action, and is dedicated to promoting health and wellbeing by protecting the environment. FreshWater Accountability Project has members located throughout the state of Ohio, including members along the Ohio River and throughout the Ohio River Basin.

Introduction

During this year's review of its Pollution Control Standards, ORSANCO is debating the extreme measure of essentially eliminating the Pollution Control Standards. ORSANCO has presented the public with five proposed alternatives to its current approach to its Pollution Control Standards. Two of these (Alternatives #1 and #2) eliminate the Pollution Control Standards, either directly or in effect. In its request for public comment, ORSANCO states that Alternative #2 is preferred by the majority of the Commissioners. In addition to brief descriptions of each of the five alternatives, the

request for public comments included supplemental documents providing more detail on Alternative #2 and a mock-up of revised standards based on Alternative #2. ORANSCO provided no comparable detailed documentation or mock-up for the other alternatives.

For reasons explained more fully in the following sections of this comment, FreshWater is deeply concerned that ORSANCO is considering abrogating its responsibilities under the Ohio River Valley Water Sanitation Compact (the “Compact”) in this way.

FreshWater commends the Minority Report of Commissioners and wishes to echo and affirm the statements made therein. FreshWater also supports the comments submitted by the Water Users Advisory Committee, the Watershed Organizations Advisory Committee, the Public Information Advisory Committee, and the majority of comments offered by the Technical Committee. Lastly, FreshWater cautions against letting comments submitted by the Chemical Industry Advisory Committee and the Power Industry Advisory Committee dictate the future of standards critical for the protection and restoration of the Ohio River.

I. Ceasing to Maintain Pollution Control Standards is an Abrogation of ORSANCO’s Responsibilities Under the Compact

The expanded Analysis of Alternative #2 provided in the request for public comment relies heavily on the idea that ORSANCO’s pollution control standards are not necessary to carry out ORSANCO’s responsibilities under the Compact because states and the U.S. EPA are satisfying the requirements of this Compact. However, the premise behind Alternative #2 is more accurately articulated as ORSANCO abrogating its responsibilities under the Compact at a time when the Ohio River continues to need the clarity and support ORSANCO’s enforceable Pollution Control Standards provide.

A. The Existence of Federal and State Regulations is not Sufficient to Meet the Duties of ORSANCO under the Compact

While the Ohio River has improved in water quality since the making of the Compact, it remains the most contaminated river in the United States, and it provides drinking water for 5 million people. The preamble of the Compact states as follows:

The control of future pollution and the abatement of existing pollution in the waters of [the Ohio River] basin are of prime importance to the people thereof, and can best

be accomplished through the cooperation of the States situated therein, by and through a joint or common agency

This statement focuses on the need for Ohio River states to form an entity in order to best govern the Ohio River as a whole. It does not state that the federal government is the best entity to address the needs of the Ohio River. It also does not propose that states, independently, in implementing federally devised criteria, are in the best position to address the pollution facing the Ohio River. The fact that the Compact predates the existence of the Clean Water Act does not somehow make the needs and purposes it identifies less real.

The current leader of the United States' executive branch is an individual who vowed to eliminate the U.S. EPA once he took office, and since that time his administration has systematically worked to eliminate or reduce environmental protections. It is reprehensible that, in a time marked by dogged environmental deregulation by the federal government, a majority of ORSANCO Commissioners would argue that federal environmental regulations are adequate to meet ORSANCO's responsibilities. This is even more troublesome given the current political commitment to natural gas and petrochemical production expansion in the Ohio River basin at both the state and federal level.

The signatory states in and of themselves lack the regulatory authority necessary to carry out the stated goals of the compact. These states also differ dramatically in their approach to environmental regulation, including their respective implementations of the Clean Water Act through their approved state implementation plans. These states also differ dramatically in how well they regulate current and emerging threats to the Ohio River.

By way of example, a majority of FreshWater members reside in Ohio, where they live under a weak regulatory framework that daily fails to protect them from the pollution stemming from natural gas development and its associated waste disposal operations. Under Ohio law, the Ohio Department of Natural Resources ("ODNR") has sole and exclusive jurisdiction over most aspects of natural gas development and oil and gas waste disposal, a power it wields with little regard or opportunity for public oversight. The agency also lacks the environmental expertise and resources to monitor, assess, and address environmental problems rampant in this industry. Notably, ODNR is also not the agency in Ohio responsible for implementing the Clean Water Act.

Ohio's regulation of oil and gas waste disposal is one pervasive example of the problems associated with the state's weak regulatory framework for the natural gas industry that poses a threat to the health of the Ohio River. Wastes associated with hydraulic fracturing are known to be radioactive to varying degrees. Ohio accepts large amounts of these wastes, originating in Ohio and in other ORSANCO signatory states, for processing and disposal. These wastes typically consist of a mix of solids, liquids, and slurries that are transported to surface facilities where the waste is further processed, disposed of, or transferred to landfills for ultimate disposal. The processing at such facilities often includes the practice of "downblending," where radioactive waste is blended with other substances for disposal in landfills. Leachate from these landfills then goes to POTWs or is directly discharged into waterways under NPDES permits that lack standards for Ra-226 and Ra-228 or other radionuclides. Studies have found radioactivity to be a problem in leachate from landfills accepting oil and gas waste. Disposal of waste associated with oil and gas extraction into streams has also led to significant radioactivity accumulation near discharge sites.

Despite the immense associated environmental concerns, including known risks regarding radioactivity, oil and gas waste facilities in Ohio are regulated ad hoc through Chief's Orders issued by ODNR without guiding regulations in place. Environmental violations by the facilities are also addressed ad hoc through Chief's Orders issued by ODNR. A review of Chief's Orders for all such facilities in the state of Ohio demonstrates that these facilities are regularly violating the environmental provisions of their orders with little repercussion, and certainly without Ohio implementing any prescriptive regulations to protect the state's water resources from this type of waste. Notably, the majority of Ohio's oil and gas waste facilities are located within the Ohio River basin, with an increasing amount of them in close proximity to the River itself.

Ohio also permits the spreading of liquid waste ("brine") from oil and gas operations on roads within the Ohio River basin as a de-icer and for dust control with little processing prior to disposal in this manner. This is done without adequate testing for radioactivity prior to the substance being released on roadways. What minimal testing has been done on the brine being spread on Ohio roads shows the substance is laden with chemicals known to be harmful to human health and the environment, including benzene, toluene, ethylbenzene, xylene, and other Volatile Organic Compounds, as well as numerous metals. Disposing of oil and gas waste in this way is an example of yet another under-

regulated pathway through which the Ohio River is experiencing an onslaught of additional contaminants from the natural gas industry.

The issue of Ohio's oil and gas waste disposal regulations are but one example of the way states are failing the public and the Ohio River by not issuing adequate regulations. Such examples also exist for other signatory states including, at least, Kentucky, West Virginia, and Pennsylvania, as well as for industries other than oil and gas waste disposal. This inadequate regulation in no way satisfies the goals of the Compact or ORSANCO's duties under the Compact. As such, Alternatives #1 and #2, or any alternative eliminating or reducing ORSANCO's role in setting, maintaining, implementing, enforcing, and revising the Pollution Control Standards is an abrogation of ORSANCO's responsibilities under the Compact.

B. ORSANCO's Pollution Control Standards Include Criteria for Parameters Not Addressed in Federal and State Standards and Act to Implement State and Federal Standards in a coherent manner to protect the Ohio River as a Whole

As stated in the Commission's Minority Report, ORSANCO's Pollution Control Standards include criteria for 188 parameters for which the states or U.S. EPA have no such criteria. This alone should defeat any notion that ORSANCO standards are redundant to standards established by the U.S. EPA and signatory states' through their approved implementation programs under the federal Clean Water Act. Furthermore, and as also stated in the Commission's Minority Report, "the presence of an individual parameter in an approved state program under the Clean Water Act, or the presence of a mixing zone or antidegradation policy in an approved state program, does not assure that *implementation* of that standard or policy is being undertaken in a manner that is coherent among the states in the basin, or is sufficiently protective of the Ohio River downstream of the state in question."

These points are particularly salient when considering the impact of ORSANCO's criteria on the drinking water of 5 million people. In its comments on the PCS Review, the Water Users Advisory Committee, gives several examples of how ORSANCO's Pollution Control Standards protect drinking water in ways that state and federal regulations have not. One example is ORSANCO's ammonia criterion that was specifically designed to protect the public's drinking water from ammonia levels in source water that would compromise utilities' disinfection processes. ORSANCO's implementation of this criterion gave the public adequate protection for its sourcewater

to ensure drinking water was not compromised. Other ORSANCO criteria essential for protecting public drinking water, that are not otherwise adequately addressed in state or federal criteria, include E. coli; Fecal Coliform; temperature; combined radium-226 and radium-228; gross total alpha; total gross beta; total gross strontium-90; and silver.

These ORSANCO criteria are directly relevant to the risks posed by the continued and proposed growth of industries associated with natural gas extraction, production, transport, and waste disposal, including petrochemical production in the Ohio River basin. Much of this development exists or is proposed along, on, and even under the Ohio River itself. Radium-226 and radium-228 are known constituents of concern in flowback and wastes from the Marcellus and Utica shale. Despite this fact, there is simply no set of regulations at the state or federal level providing comprehensive protection from radioactive contaminants entering public drinking source water.

Headlines across the U.S. have made the public more aware that public drinking water systems are not miracle workers, that source water matters. Drinking water utilities can only do so much to address the contamination of their source water, and what they can do has real costs, costs that are often borne by the individuals, families, businesses, and institutions paying the water bills. ORSANCO has a critical role to play in drinking source water protection, a role that is currently not being filled by state or federal regulations. Because of its basin-wide jurisdiction, ORSANCO is uniquely positioned to address these grave concerns facing the Ohio River and the people who rely on it. ORSANCO should be using this unique position to carry out its duties under the Compact instead of proposing to neglect its responsibility in the face of immediate threats to the river's health.

C. The three-year review requirement provides the agility necessary to address current and developing threats to the Ohio River based on the most up-to-date science

The three-year review requirement for the Pollution Control Standards allows ORSANCO to adopt and implement criteria needed to protect the Ohio River and address immediate concerns more rapidly than may be possible for federal and state agencies. This agility is critical to respond to the actual needs of the River. The three-year review requirement is not superfluous, but rather one of the qualities that gives ORSANCO the potential to provide for the effective regulation of real threats when federal and state agencies lack the agility to respond in a timely fashion.

D. The make-up of ORSANCO works to ensure the Pollution Control Standards are set based on the needs of the Ohio River instead of the interests of Polluters

ORSANCO's unique jurisdiction and specific commitment to a water body should work to insulate ORSANCO from both local and national politics in a way that allows the Commission to set the standards that the Ohio River needs, not the standards purchased by moneyed interests.

Unfortunately, that the majority of Commissioner's desire to strip ORSANCO of its role in maintaining, administering, and periodically updating its Pollution Control Standards suggests that a large part of the Commission is not immune from such lobbying efforts by polluters. Indeed, the undue weight given to comments made by the Chemical Industry Advisory Committee and the Power Industry Advisory Committee indicate that the Commission is at risk of prioritizing industrial bottom lines over the drinking water source of over 5 million people and a valuable ecological system.

Comments submitted by the Chemical Industry Advisory Committee suggest ORSANCO is better suited to assessing water quality and engaging in spill detection and response. In other words, they suggest ORSANCO should continue the hard, resource-intensive work of understanding the river's problems, while rendering itself impotent to address those problems. This advisory group also states ORSANCO should be ready to clean up industries' messes, like the MCHM spill, when they occur and directly harm people's drinking water and ecological systems. This reading of ORSANCO's duties is in no way in alignment with the purpose and stated goals of the Compact.

Comments submitted by the Water Users Advisory Committee, the Watershed Organizations Advisory Committee, the Public Information Advisory Committee, the majority of comments offered by the Technical Committee, and multiple comments from the POTW Advisory Committee, all recognize the importance of ORSANCO's leadership role in setting, maintaining, and implementing its Pollution Control Standards. These groups represent the public in a way that the specificity of the industry groups do not. The majority of comments submitted by advisory committees state that it is undoubtedly in the public's interest for ORSANCO to continue its Pollution Control Standards, and that Alternative #2 is not acceptable.

ORSANCO should not relinquish its responsibilities under the Compact by reducing the Pollution Control Standards because industry has unpersuasively recommended they do so. Instead, ORSANCO should assume its role as a lead regulator for the Ohio River, just as it is asked to do by its originating document.

II. **Of the Alternatives Presented for Consideration, Alternative #4 Best Fulfills ORSANCO's Responsibilities under the Compact**

Alternative #4 addresses various concerns raised regarding effort duplication and regulatory inconsistencies by giving ORSANCO a leadership role in ensuring state regulations and implementation of standards are part of a coherent regulatory effort for the wellbeing of the Ohio River. This alternative reasonably addresses real concerns about the interaction of the Pollution Control Standards with state regulations and implementation, without abandoning ORSANCO's responsibilities as an entity uniquely charged with controlling and abating pollution of the Ohio River at large.

In addition, as stated by the Public Information Advisory Committee, Alternative #4 also increases ORSANCO's fundraising abilities. If a primary driver in eliminating the Pollution Control Standards is to better direct ORSANCO's limited resources, the elimination of the Pollution Control Standards will only work to further limit resources, giving ORSANCO even less ability to carry out its responsibilities under the Compact. ORSANCO (and, in turn, the Ohio River) is best served by ORSANCO assuming the leadership role presented in Alternative #4, which would make ORSANCO an entity worth funding.

It is also worth noting that the maintenance of existing expenditures of \$200,000 per year to support Technical and Management Staff in order to implement Alternative #4 is also the cost of having these good jobs within the Ohio River Basin and not simply some burdensome expenditure. Likewise, reductions in these budgets also result in reductions in quality employment.

III. **ORSANCO's Call for Public Comment Did Not Provide Information Sufficient for Interested Parties to Evaluate the Alternatives Presented and Unreasonably Dissuaded Public Input**

In its call for public comment, the information presented to the public on the proposed alternatives is skewed in favor of Alternative #2. Despite asking the public for input on

all aspects of the standards and on the five alternatives proposed for the future of the Pollution Control Standards, ORSANCO provides no expanded analysis for the other alternatives nor any mockup of the rules for these alternatives. Thus, the public is left with limited information on the other alternatives to use in making comments. Further, ORSANCO's statement regarding a majority of commissioners' preference for Alternative #2 serves to dissuade the public from meaningfully participating in the public comment process and demonstrates ORSANCO's willingness to serve industrial interests over carrying out its responsibilities under the Compact.

The notice contains little to no information on the cost of each alternative and the impact of each alternative on various grants available to ORSANCO. Likewise, the information available to the public provides no side by side analyses of the vast network of laws the public is being asked to compare. ORSANCO should make this information easily accessible to the public in order for the public to be able to more specifically comment on the alternatives presented.

Conclusion

The preamble of the Compact states:

[T]he growth in industrial activity within [the Ohio River basin], [has] resulted in recent years in an increasingly serious pollution of the waters and streams within the said drainage basin, constituting a grave menace to the health, welfare and recreational facilities of the people living in such basin, and occasioning great economic loss

While the Ohio River has improved in many ways since 1948, this statement remains very true. The Ohio River is still in need of a coordinated effort to protect its many uses, and ORANSCO is charged with leading that effort. FreshWater urges the Commission to embrace its unique position in governing the Ohio River and to work with states in a leadership role in protecting this invaluable fresh water resource. FreshWater urges ORSANCO to continue to maintain, implement, and revise its Pollution Control Standards. If one of the alternatives presented is to be selected, FreshWater strongly advocates for Alternative 4.

Key Assumptions/Factors Utilized in Preparation of Comparison

- 1) The most stringent criterion for any parameter is utilized for this comparison regardless of differences in the intended protected use.
- 2) The comparison removes the separation of standards by criteria type: eg. "Human Health" and "Aquatic Life".
- 3) Comparison shows where ORSANCO Pollution Control Standards require discharge permits on the Ohio River to be more stringent than the state would allow on other bodies of water.
- 4) Some parameters are not included in this comparison. These pollutants include Aesthetics, Ammonia, Bacteria, Boron, Color, Dioclyphtalate, Total Dissolved Gases, Hardness, Nitrosamines, Nutrients.
- 5) Parameters included in this summary are taken from the individual State Agency's Website and do not reflect individual State's inclusion of ORSANCO Standards through other means such as adoption of ORSANCO standards by reference, through individual permit issuance or other means.
- 6) There may be other assumptions/combinations/arrangements that staff is not aware of at this time.

ABSTRACT

Background: Industrial discharges of perfluorooctanoic acid (PFOA) to the Ohio River, contaminating water systems near Parkersburg, WV, were previously associated with nearby residents' serum PFOA concentrations above US general population medians. Ohio River PFOA concentrations downstream are elevated, suggesting Mid-Ohio River Valley residents are exposed through drinking water.

Objectives: Quantify PFOA and 10 other per- and polyfluoroalkyl substances (PFAS) in Mid-Ohio River Valley resident sera collected between 1991 and 2013 and determine whether the Ohio River and Ohio River Aquifer are exposure sources.

Methods: We measured eleven PFAS in 1608 sera from 931 participants. Serum PFOA concentration and water source associations were assessed using linear mixed-effects models. We estimated between-sample serum PFOA using one-compartment pharmacokinetics for participants with multiple samples. **Results:** In serum samples collected as early as 1991, PFOA (median = 7.6 ng/mL) was detected in 99.9% of sera; 47% had concentrations greater than US population 95th percentiles. Five other PFAS were detected in greater than 82% of samples; median other PFAS concentrations were similar to the US general population. Serum PFOA was significantly associated with water source, sampling year, age at sampling, tap water consumption, pregnancy, gravidity and breastfeeding. Serum PFOA was 40–60% lower with granular activated carbon (GAC) use. Repeated measurements and pharmacokinetics suggest serum PFOA peaked 2000–2006 for participants using water without GAC treatment; where GAC was used, serum PFOA concentrations decreased from 1991 to 2012.

Conclusions: Mid-Ohio River Valley residents appear to have PFOA, but not other PFAS, serum concentrations above US population levels. Drinking water from the Ohio River and Ohio River Aquifer, primarily contaminated by industrial discharges 209–666 km upstream, is likely the primary exposure source. GAC treatment of drinking water mitigates, but does not eliminate, PFOA exposure.

1. Introduction

Polyfluoroalkyl and polyfluoroalkyl substances (PFAS) are industrial chemicals used for stain-, stick- and water-resistant coatings, food contact papers, firefighting foams, metal plating, semiconductors and photolithographics/photolithographics (Buck et al., 2011; Lau et al., 2007). Perfluorooctanoic acid (PFOA) and

perfluorooctanesulfonic acid (PFOS) are the most widely studied PFAS. 2610–21400 tons of carboxyl PFAS were emitted to the environment 1951–2015; up to 6420 more will be emitted by 2030 (Wang et al., 2014). US PFAS manufacturers reduced PFOA emissions 91–100% by 2014 (United States Environmental Protection Agency, 2015a), but production continues internationally.

Since 1999–2000, US population serum PFAS concentrations, measured by the National Health and Nutrition Examination Survey (NHANES), have steadily decreased; median 2011–2012 concentrations were 2.08 ng/mL (PFOA) and 6.53 ng/mL (PFOS) (CDC, 2015). Food, drinking water and house dust are major exposure sources (D'Hollander et al., 2010). Children are also exposed during

E-mail address: pinneysn@ucmail.uc.edu (S.M. Pinney).

pregnancy and through breastfeeding (Liu et al., 2011). Industrial PFAS discharges can contaminate municipal source waters (Holzer et al., 2008), and contaminated water may be the most important environmental PFAS exposure source (Ericson et al., 2008).

Mid-Ohio River Valley (Huntington, WV to Louisville, KY, Fig. 1) residents may be exposed to PFAS, especially PFOA, through contaminated drinking water from the Ohio River or Ohio River Aquifer. Serum PFOA concentrations above NHANES medians were reported in the C-8 Health Project cohort in Parkersburg, WV (Emmett et al., 2006), and two Cincinnati cohorts, the Breast Cancer and the Environment Research Project (BCERP) Puberty Study (Pinney et al., 2014), and the Health Outcomes and Measures of the Environment (HOME) study (Kato et al., 2014; Braun et al., 2016). Serum PFOA concentrations were significantly associated with water utility (Pinney et al., 2014) or Ohio River Aquifer use (Emmett et al., 2006). The Ohio River Aquifer in the C-8 study area was contaminated by industrial PFOA discharges to the Ohio River (Paustenbach et al., 2007). September 2009 downstream Ohio River PFOA concentrations were 9.2–19.1 ng/L; historical PFOA concentrations were higher (Paustenbach et al., 2007). PFAS exposure may be reduced by granular activated carbon filtration (GAC). Some Ohio River Valley utilities use GAC, and GAC has reduced PFOA concentrations in other municipal water systems (Rahman et al., 2014). GAC use was associated with lower resident serum PFOA concentrations, although some were still above US general population medians (Pinney et al., 2014; Bartell et al., 2010).

To assess exposure to PFAS in Mid-Ohio River Valley residents, we measured the concentrations of 11 different PFAS in sera collected between 1991 and 2013. PFOA concentrations between

serum measurements were estimated for participants with multiple serum samples using pharmacokinetic models. We evaluated PFOA and water source associations using mixed-effects statistical models to determine whether the Ohio River and Ohio River Aquifer are significant PFOA exposure sources for residents of the Mid-Ohio River Valley.

2. Materials and methods

2.1. Study population

This analysis included participants from the Fernald Community Cohort (FCC), Ohio River Valley (ORV) Study and BCERP Puberty Study Cincinnati site cohort. FCC adult participants were recruited from residents living less than 8 km from a uranium plant 32 km northwest of Cincinnati, primarily between 1990 and 1994; follow-up continued through 2008. Eligibility, design and participant characteristics were described previously (Wones et al., 2009; FCC website). Cohort members were eligible for inclusion in this study if they lived in zip codes bordering the Ohio River from Gallipolis, OH to southeast Indiana sometime between 1980 and 2008 (Fig. 1). An additional 20 members of the remaining FCC cohort were included because they had nuclear family members living between Parkersburg, WV and Cincinnati, OH during those years. A total of 450 FCC cohort members were contacted in 2011–2014 for additional residential history and beverage consumption data collection.

We recruited ORV participants between 2009 and 2012 from medical practices in Huntington, Portsmouth, OH, and Cincinnati suburbs; some family members of BCERP participants were

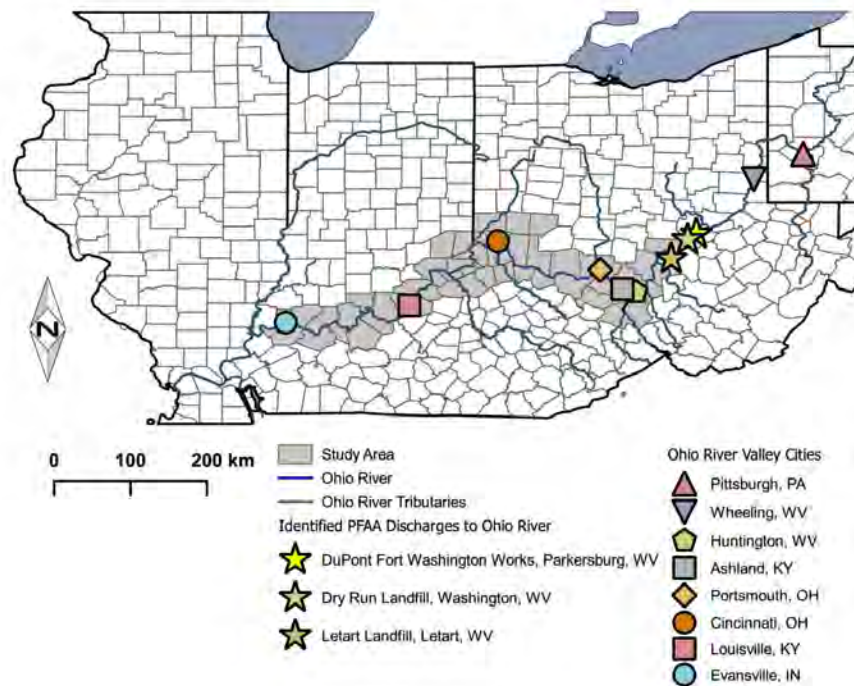

Fig. 1. The Ohio River Valley.

included. Participants were eligible if they had lived in the area for 2 or more years and were aged 2–85 years. ORV participants were not followed-up. BCERP participants were recruited as girls aged 6–8 years from Greater Cincinnati schools and Breast Cancer Registry of Greater Cincinnati participant families between 2004 and 2007. Follow-up continued until 2015. Study design and participant characteristics were previously described (Hiro et al., 2010). Institutional review boards (IRB) at the University of Cincinnati and Cincinnati Children's Hospital Medical Center approved study protocols. Participant/parent consent and child assent were obtained. The Centers for Disease Control and Prevention (CDC) IRB approved the analysis of serum specimens with no personal identifiers for BCERP. For FCC and ORV, CDC laboratory involvement did not constitute engagement in human subjects research because samples were completely de-identified.

2.2. Serum samples and analysis

We obtained serum at baseline, second and/or final medical exam from FCC participants (1991–2008), at recruitment for ORV participants (2009–2012), and annually for BCERP participants (2005–2013) using protocols and materials provided by CDC. Sera were stored at -80°C until analysis. All available samples for FCC and ORV participants were analyzed. All BCERP participants with blood samples had baseline samples measured. Subsequent samples from BCERP participants were analyzed if available.

CDC staff measured serum PFAS concentrations at various times between 2005 and 2014 using published methods (Kato et al., 2011; Kulkarni et al., 2005). CDC measured 2-(*N*-ethyl-perfluorooctane sulfonamido) acetic acid (Et-PFOSA-AcOH or EtFOSAA), 2-(*N*-methyl perfluorooctane sulfonamido) acetic acid (Me-PFOSA-AcOH or MeFOSAA), perfluorohexane sulfonic acid (PFHxS) and perfluorononanoic acid (PFNA) in all samples. CDC measured total PFOA and total PFOS in ORV, FCC and baseline BCERP samples. Linear (*n*-PFOA) and non-linear (branched) PFOA and linear (*n*-PFOS), methyl (Σ_2 -PFOS) and dimethyl (Σ_2 -PFOS) PFOS isomer concentrations were reported separately for non-baseline BCERP samples (collected 2006–2013); we calculated total PFOA and PFOS concentrations as the sums of their respective linear and branched isomers. Perfluorodecanoic acid (PFDeA) was not measured in the first 82 BCERP samples. Perfluorobutane sulfonic acid (PFBS), perfluorododecanoic acid (PFDoA), perfluoroundecanoic acid (PFUA) and perfluorooctane sulfonamide (PFOA or FOSAA) were not measured in all samples because more than 80% of results were below limits of detection (LOD) in initial analyses.

2.3. Covariates

Questionnaires, including demographics, beverage consumption, residential, medical and reproductive histories, were administered annually to adult participants and parents of minors (BCERP and FCC), or at recruitment (ORV). FCC participants answered additional residential history and beverage consumption questions when recontacted. Participants used glassware or life-size illustrations to estimate beverage consumption. FCC participants received medical exams every two (1997–2008) or three years (1990–1996). We collected anthropometrics at recruitment for ORV participants. Physical exams were administered semi-annually to BCERP participants until 2010, then annually. Calibrated stadiometers and scales were used for anthropometrics. We obtained participants' residential histories from 1980 (for those born before 1980) or birth (for those born after) by interview (BCERP, ORV) or mailed questionnaire (FCC). We identified water utilities, sources, service areas, service dates and GAC use from 1980 to 2012 through utility and public record searches, resulting in 221 water source-

time zones, served by 114 utilities, utilizing 23 water sources (Pinney et al., 2014). Water sources, durations and GAC treatment were identified for each residential address of each participant.

2.4. Statistical analysis

Statistical analyses were conducted with SAS v9.2 (SAS Institute, Cary NC). PFAS concentrations were non-normal (skewness: 2.29–9.44) and log-transformed for analyses; LOD/ $\sqrt{2}$ was imputed for values below LOD (Hornung and Reed, 1990). We calculated sample-weighted Pearson correlations and descriptive statistics for PFAS and water sources, and then estimated serum PFOA-covariate associations using two linear mixed-effects models with random subject effects (PROC MIXED).

Model 1 categorized participants' water source at sample collection in eight groups: Ohio River in Huntington, Ashland/Ironton/Portsmouth, Northern Kentucky and Cincinnati, Ohio River Aquifer between Huntington-Cincinnati and Cincinnati-Louisville, the Great Miami Aquifer and all other water sources. Model 2 used participants' cumulative years the Ohio River, with and without GAC, and Ohio River Aquifer were municipal water sources. Sample collection year, sex, age at sample collection, daily tap water consumption, bottled water use, water filter use, pregnancy status, reproductive history and breastfeeding were covariates. Race/ethnicity was not included in analyses because 93% of non-Caucasians used the same water utility. Water source was always included in regression models; other covariates were retained if significant or caused a 15% or greater change in water source effect estimates (backwards/stepwise elimination). Linear regression analyses for other PFAS with 80% or more results above the LOD were conducted using significant terms from PFOA models as covariates, similar to Pinney et al. (2014). We approximated model r^2 as variance change between full/final and intercept-only models; intercept model random variance was constrained to that in full/final models.

2.5. Pharmacokinetics

Serum PFOA concentrations between samples were estimated using a one-compartment (serum) pharmacokinetic model for 508 participants from the FCC and BCERP cohorts with multiple samples (Thompson et al., 2010). Using this model, we examined two exposure scenarios. In Scenario 1, we assumed Ohio River PFOA concentrations from 1991 to 2013 were the same as those measured in September 2009 (Emery et al., 2010). In Scenario 2, we estimated annual PFOA Ohio River concentrations for 1991 to 2013 by linearly-interpolating between reported concentrations, assuming constant ratios between regions (Table S1). For both scenarios, we assumed aquifer-exchange or GAC treatment reduced PFOA concentrations by 50% and other source waters were uncontaminated. We used participant-reported tap water consumption for daily intake, and we assumed body weight changed linearly between measurements, to estimate PFOA dose from water utility PFOA concentration estimates. For both scenarios, non-water PFOA dose was estimated from NHANES median PFOA serum concentrations (CDC, 2015), assuming steady state. Because reported half-life estimates for PFOA vary widely, we conducted a sensitivity analysis; we calculated PFOA elimination constants using half-life estimates from 1.7 to 3.8 years, which cover estimates from the literature (Fu et al., 2016; Bartell et al., 2010; Brede et al., 2010; Olsen et al., 2007). We estimated model fit using Wilcoxon rank-sum tests on median difference, weighted kappa (κ) for PFOA quartile and interclass-correlations (ICCs), comparing predicted to subsequent measured serum PFOA concentration. Model fit statistics were calculated for all estimates, and separately by starting

Re: Comments on ORSANCO's Pollution Control Standards (PCS) Revisions

To Whom It May Concern:

The following comments are submitted by the West Virginia Manufacturers Association ("WVMA") in support of ORSANCO's proposed Pollution Control Standards ("PCS") revisions. They are intended to be a supplement to the comments that we provided to ORSANCO on February 23, 2018. As we noted at that time, the WVMA has members with operations along the Ohio River. Most of those members operate in highly-regulated industries that are subject to the federal Clean Water Act ("CWA"), the West Virginia Water Pollution Control Act, and a myriad of other federal and state environmental programs, in addition to the PCS. Our members are very interested in eliminating redundancy where possible, and appreciate the opportunity to offer these comments.

When ORSANCO was created in 1948, there was a critical need for water quality improvement in the Ohio River, and no effective means of achieving it. ORSANCO played an important role in enhancing water quality in the Ohio River and in providing water quality data and information to the States and the public. Since the adoption of the 1972 CWA amendments, though, a comprehensive system of federal and state water quality and permitting programs has been developed and implemented in all the ORSANCO Compact States. The result has been a dramatic improvement in the quality of the Ohio River and its tributaries. In light of the changes in state and federal water quality regulation that have occurred since the 1970s, it is appropriate to step back and evaluate how ORSANCO can best fulfill its mission to protect water quality in the Ohio River in the years to come.

WVMA believes that the proposed PCS revisions satisfy the goals of the ORSANCO Compact and will ensure the continued protection of water quality and aquatic life in the Ohio River, in

light of the complementary programs in the Ohio River basin. Today, each of the Compact States is implementing a water quality program approved by the U.S. Environmental Protection Agency (EPA) pursuant to the Clean Water Act. Each state program includes designated uses, narrative and numeric water quality criteria, mixing zone provisions and antidegradation requirements. EPA reviews and approves all such requirements to ensure they meet the requirements of the CWA. Moreover, the CWA provides powerful enforcement mechanisms far exceeding anything available to ORSANCO.

Accordingly, a comprehensive regime protecting each State's streams as aquatic habitats and supporting their uses for recreation and drinking water has been in place for over 40 years. The PCS provide no demonstrable additional environmental benefit to the Ohio River. We believe that

ORSANCO can provide the most value in the current regulatory environment, and best meet the goals of the ORSANCO Compact, by concentrating on its scientific and technical information gathering and research. This role allows ORSANCO to continue assisting the States in carrying out their obligations under the CWA, as well as coordinate and promote consistency in water quality regulation in the Ohio River basin.

In addition to the foregoing general comments, the WVMA makes the following particular observations:

- The PCS are largely duplicative of the States' CWA-driven water quality standards. Beneficial use designations are essentially identical. Most water quality criteria are either the same or provide the same degree of human health and aquatic life protection. Mixing zone designations are similar. In light of federal and State technology-based discharge requirements and water quality-based limits, the PCS wastewater discharge requirements are superfluous for most categorical industrial dischargers and municipal dischargers.
- Where there are differences between the ORSANCO PCS and state water quality criteria and implementation procedures, the PCS – which must be implemented by the States – sometimes result in NPDES permit conditions that are more stringent than otherwise required by the States' standards. The state standards are developed with particular local conditions in mind, and criteria that are developed with those conditions in mind should be given priority over ORSANCO standards. For example, several years ago West Virginia surveyed state residents to determine how much fresh water fish they were eating. That figure should be used to calculate water quality criteria in West Virginia, and it should control over ORSANCO criteria that are generated using EPA default, national-average fish ingestion figures.
- Unlike state water quality standards development and implementation, the process for

adoption of the PCS provides no opportunity to challenge the appropriateness or legality of the PCS. The result is that if a regulated entity believes that a particular PCS requirement is inappropriate, it has no clear avenue for appeal, which deprives permittees of regulatory and legal due process. A permittee might challenge a PCS condition in U.S. District Court, but that option is not uncertain and cumbersome.

- Implementation of the PCS creates a separate set of standards that apply only to the Ohio River, and that differ from the standards that apply throughout the remainder of each of the Compact States. Eliminating this confusion will improve regulatory consistency and promote clarity for the regulated community.
- The ORSANCO PCS add another layer of complexity in the already expansive federal and state environmental regulatory scheme. Thus, the regulated community must allocate finite available company resources to stay abreast of and ensure compliance with these duplicative environmental laws and regulations.
- Some ORSANCO Compact States treat the ORSANCO PCS as mandatory, the equivalent of state regulation, and apply them in permits as such. Other states consider the ORSANCO PCS, but do not follow them slavishly. This sort of disparity works to disadvantage those dischargers who are located in a state that does not flexibly apply ORSANCO standards when issuing NPDES permits for the Ohio River.
- ORSANCO Compact States already evaluate EPA-recommended criteria when setting their respective water quality standards. Eliminating the numeric criteria-setting process would relieve ORSANCO of the significant burden of periodically reviewing and updating water quality criteria for the many pollutants currently regulated under the PCS.
- The resources ORSANCO currently devotes to the PCS program can be more effectively used to support other ORSANCO programs that do not overlap with state and federal water quality programs, and that provide value to the States. As noted above, ORSANCO has particular skill and expertise in assessing water quality and the biological integrity of the Ohio River, and disseminating that information to the States and the public to ensure coordination and consistency among the States' regulatory programs through information gathering and coordination. These functions complement the existing state/federal CWA regime without unnecessarily wasting regulatory resources and creating confusion for the regulated community.
- Most importantly, data from ORSANCO's monitoring shows that the beneficial uses of the Ohio River are being protected. Those few small exceptions already are being addressed through the States' CWA programs, under EPA oversight.

In sum, WVMA believes that the proposed revisions to the ORSANCO PCS will help maintain the beneficial uses of the Ohio River consistent with the mandates of the ORSANCO Compact, while removing duplicative and unevenly-applied regulations. The PCS revisions

will also allow ORSANCO to concentrate resources on those tasks that it can best perform in promoting and preserving water quality in the Ohio River.

The WVMA appreciates the opportunity to make its views known, and hopes you will carefully consider these comments. We look forward to the Commission's formal approval of the PCS revisions at its October 2018 meeting.

Sincerely,

/s/Rebecca McPhail

**Technical Comments of the Ohio Environmental Council regarding ORSANCO's
Revisions to its Pollution Control Standards**

Introduction

The Ohio Environmental Council (the "OEC") is a statewide non-partisan, non-profit environmental and conservation advocacy organization. We are committed to ensuring clean water, air, and energy for all of Ohio's residents. For well over half a century, The Ohio River Valley Water Sanitation Commission ("ORSANCO" or "the Commission") has provided robust protections, especially as it developed its Pollution Control Standards following the passage of the Clean Water Act in the 1970s.

ORSANCO's present efforts to repeal the substantive portions of the Pollution Control Standards flies in the face of the Commission's historical efforts to ensure consistent and reliable pollution control throughout the Ohio River and its tributaries. As illustrated by ORSANCO's minority report and the comments of numerous organizations, the

Pollution Control Standards provide numerous numeric criteria not included in the water quality standards of some of the states along the River.

In its request for comment, ORSANCO states that it “is particularly interested in receiving technical and scientific information or data that supports comments on the proposed revisions.” Accordingly, the OEC submits the following comments to satisfy ORSANCO’s request.

The Intent of the Proposed Changes to ORSANCO’s Pollution Control Standards

ORSANCO justifies rescinding the substantive portions of its Pollution Control Standards based on the following conclusions, as stated in the “Marked Version” of the revised Pollution Control Standards:

“Because all states are mandated by the federal Clean Water Act to adopt and submit for USEPA approval a program that addresses designated uses, free from mandates, wastewater discharge requirements, water quality standards, mixing zones, and more, the Commission has concluded that the requirements of the Compact are being satisfied by member state programs implementing the federal Clean Water Act. The Commission has also concluded that all of its member states are implementing programs approved under the federal Clean Water Act for the safe and satisfactory uses of the Ohio River as public and industrial water supplies after reasonable treatment, suitable for recreational usage, capable of maintaining fish and other aquatic life, and that therefore the requirement of the Compact are being satisfied by member states through these programs.

Given the fact that all member states are implementing approved programs under the federal Clean Water Act, the Commission will discontinue the triennial review process of updating the PCS rules. By proceeding under this approach the Commission is confident that public will have the full and complete protection of the federal Clean Water Act and the oversight of USEPA and the states without the redundancy of the current PCS program.

The standards set forth in this document are intended to be the mandatory requirements to be applied to the Ohio River as established in the Compact.”

ORSANCO’s argument boils down to a simple claim: because state’s implement programs that satisfy the Clean Water Act, states satisfy the requirements of the aforementioned Compact. However, ORSANCO ignores the spirit of the Clean Water Act and the Ohio River Valley Water Sanitation Compact. By rescinding the substantive numeric water quality criteria contained within the Pollution Control Standards, ORSANCO sets in motion a chain of events that will inevitably harm the water quality of the Ohio River.

Conflicts with the Clean Water Act and ORSANCO’s Compact

When Congress originally passed the Clean Water Act, it established policy goals to eliminate the discharge of pollutants into navigable waters and to prohibit the discharge of toxic pollutants in toxic amounts. Clean Water Act, Sec. 101 (a). While the United States has not achieved that laudable goal, waterways all across the country

have much better water quality now than in the early 1970s. .

Similarly, the Ohio River Valley Water Sanitation Compact established particular water pollution obligations for the signatory states to the compact, including all of the following:

- Faithful cooperation in the control of future pollution in and abatement of existing pollution from the rivers. See Ohio River Valley Water Sanitation Compact, Article I.
- Enactment of necessary legislation to enable each State to place and maintain in the waters a satisfactory sanitary condition, available for sale and satisfactory use as public and industrial water supplies after reasonable treatment, suitable for recreational usage, capable of maintaining fish and other aquatic life, and free from unsightly or malodorous nuisances due to floating solids or sludge deposits. See Ohio River Valley Water Sanitation Compact, Article I.
- Pollution by sewage or industrial wastes originating within a signatory State shall not injuriously affect the various uses of the interstate waters. See Ohio River Valley Water Sanitation Compact, Article VI.

Article VI of the Compact further establishes the methods through which ORSANCO achieves the goal of avoiding interstate water pollution. Specifically, the Compact allows ORSANCO to promulgate rules to protect the public health or to preserve the waters for other legitimate purposes, and those rules are developed and determined as necessary by the Commission. The Commission may promulgate rules governing the following affirmative obligations:

- The removal of not less than forty-five per cent of the total suspended solids, and in specific instances a higher degree of treatment to achieve the goals in Article I of the Compact
- The modification or treatment of industrial wastes discharged or permitted to flow into the Ohio River, to such a degree necessary to achieve the goals stated in Article I of the Compact

- An insurance that any pollution into tributary waters situated wholly within one State are treated or modified so that the waters of the State are of equal water quality to the waters of the Ohio River

Both the Clean Water Act and the Compact enshrine the policy goal to eliminate water pollution from the waterways of the United States. However, the Clean Water Act was promulgated by Congress in the 1970s, while the states within the watershed of the Ohio River signed the Compact in 1948. The states tailored the compact specifically for the needs of the Ohio River, and for forty years after the passage of the Clean Water Act, the states of the Compact used ORSANCO to pass more stringent rules tailored specifically for that purpose: The Pollution Control Standards.

However, the Commission argues in its revised Pollution Control Standards that the requirements placed by the Clean Water Act upon the individual signatory states to the Compact satisfy the requirements of the Compact itself. The Commission has trapped itself into erroneous logic. If the goal of the Clean Water Act is to eliminate all pollution into the waters of the United States, eliminating Pollution Control Standards that are more stringent than the rules promulgated under the Clean Water Act cannot achieve such a goal.

Similarly, the Compact authorizes the Commission to promulgate rules to achieve the Article I and Article VI objectives of the Compact, and for forty years the Commission has believed that the additional protections provided by the Pollution Control Standards are necessary to satisfy the Compact beyond the federally required standards from the Clean Water Act. ORSANCO has a duty to promulgate rules that enforce the provisions of the article; if it makes changes to already promulgated rules, it must provide evidence that those changes further the goals of the Compact. ORSANCO has not provided evidence that shows that a lessening of the Pollution Control Standards will improve water quality, or keep the water quality of the Ohio River at its current level.

In fact, all the evidence points in the opposite direction. By removing the Pollution Control Standards, ORSANCO will weaken the strength of water quality standards used by state environmental agencies in the development of NPDES Permits. In turn, this will impact the water quality of the Ohio River and adjoining tributaries. With the varied standards between the signatory states as evidenced in the Minority Report, ORSANCO risks increased instances of transboundary water pollution between states with water quality standards.

Significant Differences between Ohio EPA Regulations and ORSANCO PCS

To emphasize the shift in applicable water quality criteria that communities along the Ohio River will face if ORSANCO amends these Pollution Control Standards, the OEC has catalogued the differences between the Standards and the Ohio EPA's water quality criteria for the protection of human health. In **Appendix I**, we have provided a complete chart that notes these differences. In addition to the actual data showing the specific discrepancies, we have provided narrative discussing a nonexhaustive subset of particular substances that pose both a significant danger to public health and have significantly different water quality criteria under the Ohio EPA when compared to ORSANCO's Pollution Control Standards.

Finally the OEC attaches as **Appendix II** a 2011 proposed water quality standard for the Ohio River. These 2011 proposed water quality standards were never adopted by the agency, but the agency readily admits the following in its fact sheet explaining the 2011 proposed rulemaking:

Existing rule 32 includes tables of water quality criteria that are combinations of Ohio and ORSANCO (Ohio River Valley Water Sanitation Commission) water quality criteria. The existing rule is being rescinded and replaced with new rule 32 that identifies applicable use designations and incorporates the criteria from the ORSANCO "Pollution Control Standards for discharges to the Ohio River" that are more stringent than the criteria for those use designations. *Draft Rules – Surface Water Quality Water Quality Standards (OAC Chapter 3745-1)*, Ohio Environmental Protection Agency, (December 2010), http://www.epa.state.oh.us/portals/35/rules/fs_ipr_wqs_dec10.pdf.

OAC 3745-1-32(A) and Table 32-1

Ohio EPA implements water quality standards for the Ohio River at OAC 3745-1-32. Generally speaking, these water quality standards implement the numeric criteria promulgated in OAC 3745-1-33 and 3745-1-34 for the Ohio River. However, OAC 3745-1-32 does include certain criteria not mentioned in other sections, including Table 32-1, which implements water quality criteria similar to parameters found in ORSANCO's current Pollution Control Standards. Specifically, Table 32-1 implements water quality criteria covering bacteria (fecal coliform), cyanide, dissolved oxygen, radionuclides, and temperature.

In its more generalized water quality criteria for the entire state for the protection of human health, the Ohio EPA lacks water quality criteria covering radionuclides and fecal coliform. If the grounding for Table 32-1 comes from ORSANCO's Pollution Control Standards, the OEC hopes the Ohio EPA does not choose to rescind that water quality criteria if ORSANCO rescinds the substantive portions of the Pollution Control Standards.

Ammonia

Ammonia is an inorganic gas produced naturally and is used in a variety of processes, such as fertilizers and cleaners; it can affect the dermal, ocular, and respiratory

systems. See “Ammonia”, Agency for Toxic Substances & Disease Registry, <https://www.atsdr.cdc.gov/substances/toxsubstance.asp?toxid=2>. Ohio EPA lacks water quality criteria for Ammonia but ORSANCO proposes a limitation of 0.1 mg/L. As noted in the technical comments produced by the Environmental Law & Policy Center, a number of NPDES permits along the Ohio River have implemented ammonia limitations based on the ORSANCO Pollution Control Standards, even when their state has not promulgated water quality criteria for ammonia.

Benzidine

Benzidine, a confirmed human carcinogen, affects the liver, immune system, and nervous system. See “Benzidine”, Agency for Toxic Substances & Disease Registry, <https://www.atsdr.cdc.gov/substances/toxsubstance.asp?toxid=105>. Ohio’s water quality standard for the Ohio River limits Benzidine to 0.0012 micrograms per liter, while ORSANCO’s current standards limit Benzidine to 0.000086 micrograms per liter.

Bromoform

Bromoform is a non flammable liquid with a sweet odor that can sometimes form naturally in plants or in the ocean. See “Bromoform & Dibromochloromethane”, Agency for Toxic Substances & Disease Registry, <https://www.atsdr.cdc.gov/substances/toxsubstance.asp?toxid=128>. The substance is still used as a laboratory reagent in the U.S., though was used as a flame retardant or solvent in the past. It affects the liver, nervous system, and kidneys. For the Ohio River, the Ohio EPA has limited Bromoform to 43 micrograms per liter, but ORSANCO’s standards limit the substance to 4.3 micrograms per liter.

Chloroform

Chloroform, a colorless liquid formerly used as an anesthetic, is still used to create other substances and can form naturally when chlorine mixes with water. See “Chloroform”, Agency for Toxic Substances & Disease Registry, <https://www.atsdr.cdc.gov/substances/toxsubstance.asp?toxid=16>. Chloroform can affect the cardiovascular system, liver, nervous system, and urinary system, and can also disrupt reproductive systems and the development of children. In the Ohio River water quality standard, the Ohio EPA limits chloroform to 57 micrograms per liter, while ORSANCO limits it to 5.7 micrograms per liter.

Cyanide

The dangers of cyanide need know introduction; while infamous as a “poison,” its used throughout industry in the production of organic chemicals, electroplating, metallurgy, photography, and more. See “Cyanide”, Agency for Toxic Substances & Disease Registry, <https://www.atsdr.cdc.gov/substances/toxsubstance.asp?toxid=19>. Cyanide affects the skin, the nervous system, and the reproductive systems. The Ohio EPA listed “free” Cyanide in its Ohio River water quality standard at 200 micrograms per

liter at intakes, and 700 micrograms per liter everywhere else. Additionally, Table 32-1 at OAC 3745-1-32 provides further limitations for “free” Cyanide, at 44 micrograms per liter inside mixing zones and 22 micrograms per liter for an outside mixing zone maximum.

While ORSANCO does not provide a “free” cyanide pollution control standard for the protection of human health (it does list a standard for the protection of aquatic life), ORSANCO does limit total cyanide at 140 micrograms per liter. The Ohio EPA does not provide water quality criteria for total cyanide.

DDD, DDE, and DDT

DDT is a pesticide banned in 1972; DDE and DDD are related chemicals that occur when commercially preparing DDT. See “DDT, DDE, DDD”, Agency for Toxic Substances & Disease Registry, <https://www.atsdr.cdc.gov/substances/toxsubstance.asp?toxid=20>. A probable human carcinogen, these related chemicals have developmental effects, and impact the endocrine, hepatic, neurological, and reproductive systems. The Ohio EPA limits DDD in the Ohio River’s water quality standard to 0.0083 micrograms per liter, and DDE and DDT to 0.0059 micrograms per liter. Conversely, ORSANCO limits DDD to 0.00031 micrograms per liter, and DDE and DDT to 0.00022 micrograms per liter.

E Coli and Fecal Coliform

The Ohio EPA regulates E. coli and fecal coliform hand-in-hand in its Ohio River water quality standard. In Table 32-1, Ohio EPA notes that “for the months of May to October, measurements of Escherichia coli bacteria may be substituted for fecal coliform.” When substituting, the content of E. coli cannot exceed 130 per 100 mL. Ohio EPA requires that “the maximum allowable level of fecal coliform bacteria shall not exceed two hundred ml as a monthly geometric mean based on not less than five samples per month.” However, between November and April. Fecal coliform bacteria may not exceed 2100 ml.

On the other hand, ORSANCO limits E. Coli to 130 CFU/100 mL and fecal coliform to 2000 CFU/ 100 mL. In the Ohio EPA’s Ohio River water quality standard, the agency has essentially adopted ORSANCO’s limitation, with slight variation in the maximum allowable fecal coliform limit. However, the Ohio EPA does not have a fecal coliform or E. coli standard under its own water quality criteria; if Ohio EPA has based these values on the work of ORSANCO, then rescinding the Pollution Control Standards may incentivize the Ohio EPA to rescind its own standards for these dangerous bacteria.

Isophorone

Isophorone is an industrial solvent that occurs naturally in cranberries; it affects the hepatic system. See “Isophorone”, Agency for Toxic Substances & Disease Registry,

<https://www.atsdr.cdc.gov/substances/toxsubstance.asp?toxid=148>. In the Ohio River water quality standard, the Ohio EPA limits Isophorone to 360 micrograms per liter, while ORSANCO limits it to 35 micrograms per liter.

Methylmercury

Methylmercury is a compound formed when microorganisms methylate inorganic mercury, and presents a danger to humans separate from inorganic mercury due to “its variable toxicity dependent on its form, inflow path, exposure amount, and individual susceptibility.” “Methylmercury Exposure and Health Effects”, J Prev Med Public Health. 2012 Nov; 45(6): 353–363. Published online 2012 Nov 29. doi:

10.3961/jpmph.2012.45.6.353. The Ohio EPA does not provide any numeric criteria for methylmercury in its water quality standard for the Ohio River, though it does provide standards for mercury at 40 micrograms per liter at outtakes and 100 micrograms per liter everywhere else.

However, ORSANCO provides a specific limitation for methylmercury for the Ohio River, at 0.3 mg/kg for the protection of human health.

Combined radium 226 and 228; Total gross strontium 90

For the Ohio River, the Ohio EPA has implemented limitations for “radionuclides,” which includes radium-226 (but does not include radium 228), and gross strontium-90. The limitations provided by the Ohio EPA match the values promulgated by ORSANCO in its standards. However, the Ohio EPA has not promulgated radionuclide water quality criteria elsewhere, so if ORSANCO rescinds its PCS which include these numeric values, Ohio EPA may decide to rescind its own values, too.

Silver

Similarly, the Ohio EPA has included in its Ohio River water quality standard a limitation for Silver at 50 micrograms per liter, matching ORSANCO’s limitation in its Pollution Control Standards. Likewise, the Ohio EPA has not promulgated water quality criteria for Silver anywhere outside the Ohio River water quality standard, so if ORSANCO rescinds its standards, Ohio EPA may choose to rescind its limitation upon Silver for the Ohio River.

Tetrachloroethylene

Tetrachloroethylene is a substance used in dry cleaning and metal-degreasing and other industrial processes; it is a probable carcinogen, and affects developmental, neurological, and respiratory systems. See “Tetrachloroethylene”, Agency for Toxic Substances & Disease Registry,

<https://www.atsdr.cdc.gov/substances/toxsubstance.asp?toxid=48>. The Ohio EPA has established in the Ohio River water quality standard a limitation of 5 micrograms per liter for this substance at intakes, and 8 micrograms per liter everywhere else. ORSANCO proposes a more stringent limitation at 0.69 micrograms per liter.

Thallium

Thallium, while not produced in the United States, is still imported for use in manufacturing of electronic devices; it can affect the gastrointestinal, hepatic, neurological, and renal systems. See “Thallium”, Agency for Toxic Substances & Disease Registry, <https://www.atsdr.cdc.gov/substances/toxsubstance.asp?toxid=49>. The Ohio EPA’s water quality standard for the Ohio River limits Thallium to 1.7 micrograms per liter, while ORSANCO limits Thallium to 0.24 micrograms per liter.

TCDD (Dioxin)

TCDD is the most widely studied of a family of substances known as CDDs, and it one of the most toxic; these substances are “formed during chlorination by waste and drinking water treatment plants.” “Chlorinated Dibenzo-p-dioxins (CDDs)”, Agency for Toxic Substances & Disease Registry, <https://www.atsdr.cdc.gov/substances/toxsubstance.asp?toxid=63>. Dioxin can affect the dermal, developmental, immunological, and reproductive systems and is a known carcinogen. The Ohio EPA limits Dioxin in the Ohio River to 0.13 picograms per liter; ORSANCO limits Dioxin to 0.005 picograms per liter.

Conclusion

Our comments provide insight into the inconsistent logic proposed by ORSANCO in considering an enormous substantive modification to its Pollution Control Standards. ORSANCO claims that it need not develop the Pollution Control Standards further because all states develop programs approved by the United States Environmental Protection Agency. However, ORSANCO misinterprets its fundamental purpose as a regional regulatory body. It is not designed as a body that ensures that individual state agencies satisfy federal law; for the Ohio River Valley Water Sanitation Compact creates obligations that go beyond the law put forth by the Clean Water Act. The states should cooperate together to create standards that adequately protect the Ohio River.

Perhaps the individual programs of the states along the Ohio River provide some protection, but the OEC’s analysis (and the analysis of numerous other public interest organizations) proves an irrefutable truth. Rescinding the numeric criteria within the Standards ***will eliminate water quality criteria more stringent than what currently exists within the water quality standards of the individual states.***

Removing protections already scientifically developed for the protection of human health goes against the purpose of both the Compact and the Clean Water Act. ORSANCO has provided no scientific justification for removing these numeric criteria. Therefore, the Commissioners must vote against the proposal to modify the Pollution Control Standards; any other choice is a clear dereliction of their duty to collectively protect the waters of the Ohio River.

Respectfully submitted,

Chris Tavenor | Law Fellow

Ohio Environmental Council

Appendix I

NOTE: The numerical values for the Ohio Water Quality Criteria are drawn from OAC 3745-1-33 and 3745-1-34. In limited instances, the actual Water Quality Standard for the Ohio River found at OAC 3745-1-32 contains slightly different criteria than the water quality criteria found in OAC 3745-1-33 and 3745-1-34. Those differences are noted above in discussion of individual criteria where applicable.

In this chart, we compared the ORSANCO Pollution Control Standards to the Ohio Water Quality Criteria rather than the promulgated water quality standard for the Ohio River. If ORSANCO rescinds its pollution control standards, the criteria in the Ohio River water quality standard will only have the Ohio water quality criteria as a basis, and Ohio EPA could potentially remove those criteria based on ORSANCO’s Pollution Control Standards.

Ohio Water Quality Criteria			ORSANCO Pollution Control Standards

Appendix II

Below, we have provided the text of a proposed Ohio river water quality standard that was never finalized into the Ohio Administrative Code. Ohio EPA proposed this version of the Ohio River water quality standard specifically to implement the water quality criteria developed by ORSANCO that was more stringent than the previous water quality criteria of the Ohio EPA.

For instance, note that the Dioxin numeric criteria proposed in the text below is 0.005 picograms per liter, matching the ORSANCO limit but not the current Ohio water quality standard.

OH ADC 3745-1-32

OH ADC 3745-1-32 *Ohio river standards**.*

[Comment: For dates of non-regulatory government publications, publications of recognized organizations and associations, federal rules and federal statutory provisions referenced in this rule, see rule 3745-1-03 of the Administrative Code.]

The Ohio river is designated warmwater habitat, public water supply, agricultural water supply, industrial water supply and bathing waters, and will meet the criteria set forth in, or derived in accordance with, rules 3745-1-01 to 3745-1-07 of the Administrative Code and rules 3745-1-35 to 3745-1-43 of the Administrative Code. However, criteria set forth in this rule supercede the criteria for those designations where applicable.

(A) Water quality criteria for the protection of aquatic life.

Table 32-1. Ohio river water quality criteria for the protection of aquatic life.

Chemical Form¹ Units² IMZM³ OMZM³ OMZA³

Ammonia T mg/l -- Table 42-2c Table 42-2a,c

Cadmium TR ug/l Table 32-2 Table 32-2 Table 32-2

Cyanide free ug/l 44 22 5.2

Dissolved oxygen⁴ T mg/l -- 4.0b 5.0

Lead TR ug/l Table 32-2 Table 32-2 Table 32-2

Selenium TR ug/l -- 20 5.0

Temperature -- -- -- Table 32-3 Table 32-3

¹ T = total; TR = total recoverable.

² mg/l = milligrams per liter (parts per million); ug/l = micrograms per liter (parts per billion).

³ IMZM = inside mixing zone maximum; OMZM = outside mixing zone maximum; OMZA = outside mixing zone average.

⁴ For dissolved oxygen, OMZM means outside mixing zone minimum at any time and OMZA means outside mixing zone minimum daily average.

a In addition, the four-day average within the thirty-day period shall not exceed 2.5 times the OMZA.

b During the April fifteen to June fifteen spawning season, a minimum concentration of 5.0 mg/l shall be maintained at all times.

c Table 42-2 can be found in rule 3745-1-42 of the Administrative Code.

Table 32-2. Water quality criteria for the protection of aquatic life for water hardness dependent criteria.

A. The equations in this table can be used to calculate numeric criteria at any water hardness up to 400 mg/l CaCO₃. The criteria at a water hardness of 400 mg/l CaCO₃ are used for water hardnesses above 400 mg/l CaCO₃. "e" = the base e exponential function. "ln H" = the natural logarithm of the water hardness. Criteria at example values of water hardness are in table 32-2B of this rule.

Table 32-2A.

(B) Water quality criteria for the protection of human health. These criteria apply everywhere in the Ohio river outside mixing zones, unless specified otherwise.

(1) Bacteria. For the protection of the public water supply use, at no time shall fecal coliform bacteria content exceed two thousand per one hundred milliliters as a monthly

geometric mean based on not less than five samples per month year round.

(2) Total ammonia-nitrogen. Total ammonia-nitrogen shall not exceed one milligram per liter at any surface water intake for a public water system.

(3) Radionuclides. Gross total alpha activity (including radium-226, but excluding radon and uranium) shall not exceed fifteen picocuries per liter (pCi/l) and combined radium-226 and radium-228 shall not exceed four pCi/l. Concentration of total gross beta particle activity shall not exceed fifty pCi/l. Concentration of total gross beta particle activity shall not exceed fifty pCi/l; the concentration of total strontium-90 shall not exceed eight pCi/l.

(4) Total dissolved solids. Total dissolved solids shall not exceed five hundred milligrams per liter at river flows equal to or greater than the minimum seven day, ten year flow at drinking water intakes.

(5) In addition to the criteria in table 32-4 of this rule, the water quality criteria identified in table 40-2 of rule 3745-1-40 of the Administrative Code apply everywhere in the Ohio river outside mixing zones, except that the ambient water quality criteria based on maximum contaminant levels (MCLs) identified in table 40-1 of rule 3745-1-40 of the Administrative Code apply outside mixing zones only within five hundred yards of surface water intakes for public water systems.

Subject: comment on proposed revision of teh ORSANCO Pollution Control Standards
Date: Monday, August 20, 2018 3:39:41 PM

Dear ORSANCO Commissioners,

I am writing on behalf of the Hoosier Environmental Council (HEC) to comment on the proposed revision of ORSANCO's Pollution Control Standards. HEC appreciates the opportunity to comment on this important decision.

Founded thirty-five years ago, the Hoosier Environmental Council is the largest statewide environmental policy organization in Indiana. HEC aims to advance solutions that are good for the environment and good for the economy.

The Hoosier Environmental Council is adamantly opposed to the ORSANCO proposal referred to as 'Alternative 2' since it would eliminate the ORSANCO Pollution Control Standards (PCS) and significantly weaken protection of the Ohio River.

State Programs and ORSANCO standards are not redundant

The proposal before you as ORSANCO commissioners would have ORSANCO eliminate its Pollution Control Standards for the Ohio River and allow state standards to protect the river. In their April 1, 2017, document *Alternative #2 Expanded: Clean Water Act Alternative to ORSANCO PCS Rules*, ORSANCO's Ad Hoc Committee on Water Quality Standards Implementation stated:

"By proceeding under this approach the Commission is confident that public will have the full and complete protection of the federal Clean Water Act and the oversight of USEPA and the states without the redundancy of the current PCS program."

I respectfully disagree with the argument that the PCS are redundant. The document *ORSANCO Staff Water Quality Criteria Compilation* of February 14, 2018, lists 188 instances in which there are ORSANCO standards that the member states don't have. Indiana is the worst of the states, with 50 parameters in ORSANCO standards that are missing in Indiana standards and 53 Indiana standards that are significantly weaker than ORSANCO's. Clearly, the ORSANCO PCS are not redundant.

Each of those missing or weaker standards represents a chemical that will be allowed in greater concentration in the Ohio River if the ORSANCO PCS are eliminated. Indeed, some of the proponents of the PCS elimination proposal appear to be arguing for greater leniency for chemical discharges to the river. The February 2018 comments submitted by Jupiter Aluminum Corp, Ohio Coating's Company, Wheeling Nisshin, Ohio Manufacturers Association, Arcelor Mittal, and Koppers Inc, all of which submitted identically worded comments to the initial public review of the PCS, state:

"where there are differences between the ORSANCO PCS and state water quality criteria and implementation procedures, the PCS, which must be implemented by the States, sometimes result in NPDES permit conditions that are more stringent than otherwise required by the States standards - and with no demonstrable environmental benefit."

They all concur that ORSANCO standards result in more stringent NPDES permits, which I would argue is greater protection of the river. Their statement that this has "no demonstrable environmental benefit" is refuted by the PCS writing process itself. Each of the ORSANCO standards was carefully written by ORSANCO scientists based on toxicology data over the last 70 years. Each standard was calculated to give the maximum amount of a chemical the Ohio River can tolerate and still be safe for aquatic life and for human health.

Lack of federal environmental protection

The Ad Hoc Committee's statement that in the absence of ORSANCO PCS, the public "will have the full and complete protection of the federal Clean Water Act and the oversight of USEPA" is inaccurate on several counts. First, it does not take into account the fact that the current administration in Washington is working aggressively to dismantle significant portions of the Clean Water Act and shrink the size of the USEPA.

Second, regardless of which party has been in control, historically the Clean Water Act has only provided partial protection for US streams and rivers. A report based on 2010 data from the USEPA's Toxics Release Inventory showed that there were more than 220 million pounds of toxic material discharged into American waterways that year, and the Ohio River received the largest portion (Environment America Research and Policy Center (2012). *Wasting our Waterways 2012*. <https://environmentamerica.org/reports/ame/wasting-our-waterways-2012>). Given this report on toxic releases, the ORSANCO standards need to be stronger and better implemented, not eliminated.

The Clean Water Act is also less than fully protective because the states write their standards in the setting of political pressure from their own businesses not to be too stringent. This is where ORSANCO plays a pivotal role. Only uniform standards by this multi-state compact can ensure protection the Ohio River. The processes under the Clean Water Act and USEPA are not serving the river well enough.

Impact on Indiana

Indiana is almost at the end of the 981-mile Ohio River, so with weaker standards, other states will be sending their pollution downstream to us. In EPA records, there are at least 490 permits for releasing waste into the Ohio River before it reaches the eastern edge of Indiana, including from oil and chemical industries. Reducing the standards for those discharges will hurt Indiana's drinking water and our ability to fish, boat, swim, and get clean water for businesses.

Plans for a new Appalachian Storage Hub with petroleum refining, pipelines and storage facilities along the Ohio River in Pennsylvania, West Virginia, and Ohio have received big financial backing from China. If built, the Hub will be impacting the Ohio River before it gets to Indiana, so this is another reason this is not the time to weaken pollution standards. (<https://www.appastorage.com/>)

Loss of the ORSANCO standards will also create a regulatory burden for Indiana. ORSANCO standards are cited in Indiana's Administrative Code for water discharge permits at 327 IAC 5-2-10. Their loss will leave a gap that will require Indiana to spend time and tax payer money to fix. There will be similar impacts in other states that rely on the ORSANCO PCS.

The decision to eliminate the ORSANCO PCS will have extensive and lasting impacts on the Ohio River states, both in water quality and in regulatory impacts. To date the ORSANCO commissioners have not adequately studied how loss of the standards will impact permitting, water quality, and state regulations, issues that require serious in-depth consideration before such a drastic move is made.

ORSANCO should coordinate implementation of the Pollution Control Standards rather than eliminating them

One argument for eliminating ORSANCO's standards is that the Ohio River states vary in how they use them. That should lead to efforts to coordinate use of the standards, not wipe them out. Instead of eliminating the PCS, I urge you to work with the member states to create more uniform implementation of the ORSANCO PCS.

If ORSANCO fulfills its potential to not only write standards, but coordinate implementation of the standards, then it is positioned to provide consistency and predictability for NPDES permit holders on the river, rather than the patchwork of varying standards they get from the individual states.

I urge you to reject Alternative 2, and preserve the ORSANCO Pollution Control Standards. Thank you for your consideration of the points I have provided above.

Sincerely,

Re: Proposed Revisions to Pollution Control Standards – Second Public Review

Thank you for the opportunity to comment as part of the second public review of the proposed 2018 changes to the Pollution Control Standards (PCS)

As outlined in our initial set of comments, Greater Cincinnati Water Works is opposed to the proposal to remove the water quality criteria and other language from the ORSANCO PCS. While it can be said that the current proposal does not eliminate the PCS, the retained language does nothing to protect the Ohio River quality.

We also believe the PCS are central to the overall mission of ORSANCO. The PCS should be the yardstick by which states may be measured when implementing their individual standards applicable to the Ohio River. This ensures minimum, appropriate, and consistent standards are set to protect the entire river.

We understand the PCS have some redundancy with USEPA water quality standards, but we do not view this as a reason to eliminate the standards. Rather, ORSANCO should use the USEPA standards as a starting point to ensure that standards are appropriate for the Ohio River, and then modify those standards as necessary. ORSANCO's PCS serve to uniformly address issues which may slip through the cracks of EPA Water Quality Standards or the States' standards.

ORSANCO is uniquely positioned to have a positive impact on basin-wide river quality by virtue of an existing regulatory framework extending beyond the state boundaries. Reducing or eliminating this regulatory framework removes one of the key benefits ORSANCO can provide by protecting river quality on a basin-wide basis.

ORSANCO standards should serve as guidance to the states as they address facilities impacting the Ohio River. The standards should reflect the unique needs of the river as a whole. The standards can also serve to address contaminants of emerging concern where individual states may not have the ability to do so directly.

We understand implementation and enforcement of the pollution control standards are imperfect. However, we recommend maintaining the standards and working toward consistency across all compact states. We view this as not just the responsibility of ORSANCO, but also of the individual states as part of their responsibility as members of the compact. Instead of eliminating the standards, the Commission should work toward

eliminating the weaknesses which have hampered the effectiveness of the PCS.

GCWW believes in the value of ORSANCO and will continue to work with you to ensure our drinking water source is protected. However, we are strongly opposed to the proposed changes and believe they will ultimately weaken ORSANCO as an organization and likely result in degradation of our water supply.

Thank you for the opportunity to provide input on this issue.

Sincerely,
Jeff Swertfeger
Superintendent
Water Quality and Treatment Division
Greater Cincinnati Water Works

Comments on the ORSANCO Proposed Revision to the Pollution Control Standards

To: ORSANCO Commissioners

From: National Wildlife Federation, Citizens for Pennsylvania's Future, West Virginia Rivers Coalition, Kentucky Waterways Alliance, Prairie Rivers Network, Ohio Conservation Federation, Indiana Wildlife Federation, Virginia Conservation Network, and Environmental Advocates of New York

Date: August 20, 2018

RE: Comments on the ORSANCO Proposed Revision to the Pollution Control Standards

-----Submitted via email-----

The National Wildlife Federation (NWF) and the undersigned affiliate organizations appreciate the opportunity to provide these comments in response to ORSANCO's request for comment on its review of the Pollution Control Standards (PCS) for Discharges to the Ohio River - 2015 Revision. NWF is the largest conservation organization in the U.S. with more than 6 million members, and supporters across the country.

The Ohio River is an important resource as a working river for cargo transport, a source of drinking water for five million people, a place for recreation along its 981 mile length and a home for diverse habitat for wildlife and fish. The Commission is a regional body with the mandate to manage the Ohio River as a basin system, a unique role that was forward thinking in 1948 and just as necessary today. We strongly oppose any retraction in ORSANCO's role in the development and administration of the PCS.

ORSANCO provides valuable assistance to member states in stream assessment, monitoring and spill response, and PCS administration. The rationale provided for the proposed retraction of ORSANCO's role with the PCS rules is vague with no firm analysis.

We believe that the proposed alternatives are an abdication of ORSANCO's responsibilities for managing the Ohio River as a basin system rather than individual stream segments. The purpose of ORSANCO is to provide the forum for the collaboration needed to ensure the safeguards are in place to protect the river both upstream and downstream.

1. The ORSANCO website says that the review process would include consideration of the comments received in the initial public comment period that closed in February and formulation of specific revisions to the Standards. Yet no response summary has been prepared of the many detailed comments received, nor any proposed revisions based upon those comments. No information has been provided on how the comments were considered beyond the summation of the numbers of comments received. The lack of any response to these comments by ORSANCO is a disregard of the public input. The lack of any authentic engagement with stakeholders and the public creates serious questions about this process. It appears that ORSANCO and its commissioners are moving towards a final decision based upon an insular review with a forgone conclusion without any thoughtful consideration to a lawful public review.

A closing date of August 20 for the current public comment period leaves less than six weeks to the October Commission meeting when a final vote on the proposed action is expected. Presumably, materials will need to be prepared prior to that time. There appears to be little to no opportunity for any potential revisions to be prepared and subsequent Commission review and consideration. The PCS is a highly technical, detailed program that could have many permutations worthy of consideration that could come from public input but there is very little opportunity for any thoughtful analysis much less any revisions, in this schedule.

2. The comparison tables released by ORSANCO in February depict wide variability in the number and stringency of standards by the states. We are very concerned that the response to this variability is to eliminate ORSANCO's role in the development of the standards and defer to the states. Resorting to administration by the states may seem to be an expedient approach to the Commission, but it represents a failure to invest in the collaboration needed to think beyond jurisdictional boundaries and manage the river as a whole system. The issue that needs to be solved is not the role of ORSANCO, but rather the lack of adoption/implementation by the states of the PCS into state standards.

The tables make it apparent that there are many gaps and inconsistencies among the states, ORSANCO and USEPA criteria. Yet in the narrative materials presented by ORSANCO, there is no information or analysis as to why these discrepancies have been allowed to persist. We reiterate our contention that a fundamental purpose of ORSANCO's role with the PCS is to facilitate collaboration for the establishment, adoption and implementation of the PCS.

3. We acknowledge that states have challenges in the development, promulgation and implementation of the PCS. The missed opportunity is that ORSANCO and the member states should be using their collective leverage towards getting the PCS adopted among the states so that the Ohio River is managed as one river basin, not individual stream segments within state boundaries. A regional body speaking with one voice can wield significant influence at the state level by providing a broader, more strategic view of what is best for the Ohio River. Rather than weakening the role of the body created for the purpose of facilitating a unified approach to managing the river, the Commission should be evaluating different options to bring consistency among the states in PCS adoption as part of its intended mission.

The variability among the states' adoption and implementation of the PCS should be a call to action. The only allowable variation to the PCS should be where the states have a more stringent standard. Leadership and cooperation are needed by the Commission *and* its member states to honor the pledges made by each state for the oversight of pollution abatement and health of the entire Ohio River. The Commission Compact compels the member states to act on behalf of a water body beyond its jurisdictional waters, a unique role that demands actions beyond parochial interests.

4. Elimination of the ORSANCO PCS means significant investments will need to be made by the states for the technical development of standards, the procedures for adoption, implementation of those standards and future triennial reviews as required by the Clean Water Act. While some states can adopt the PCS by reference in their state procedures, others cannot. Those states that have adopted the PCS standards by reference must now take on the work currently done by ORSANCO. There would be six public agencies conducting the work currently done by one entity. The costs of expanding this work from one entity to six should be factored into any analysis of the overall impact. The most cost-effective solution should be a primary driver for any proposed change.
5. The argument that there is redundancy between the states' water quality standards programs and ORSANCO is not valid. Yes, both the states and ORSANCO have congruent functions in the development and review of water quality standards, but that does not mean there is a duplication of effort. The focus of ORSANCO on the mainstem of the Ohio River allows the states to utilize their resources on the other water bodies within their state jurisdictions. The 981 mile length of the Ohio River requires specialized expertise for the development of standards that do not impact not only waters within a given segment of the river, but also does not jeopardize downstream water resource integrity.

We maintain that the elimination of the PCS **will result** in significant duplication of effort and increased costs. The materials provided by ORSANCO do not provide any cost/benefit analyses of the proposed alternatives.

6. The analysis conducted by the Environmental Law and Policy Center (described in the comments submitted by the Environmental Law and Policy Center) identifies more than twenty NPDES permits in six states that utilized more stringent ORSANCO criteria than the state standard in the interest of a more protective standard for the Ohio River. No comparative analysis has been undertaken to identify any permit limits whereby the state standard was more stringent than the ORSANCO PCS. However, this is precisely the analysis that ORSANCO should have undertaken to fully realize the potential consequences and impacts that could result should this proposal go forward. The ramifications of the elimination of the PCS need to be fully understood for Commission members to make an informed decision. The impacts to NPDES permit limits, a cost-benefit analysis and defined criteria for a selected course of action should be part of this process. Without these steps, Commission members are faced with a decision that lacks a full accounting of the impact to the Ohio River.
7. It defies logic that two sides of the same river segment require two separate sets of water quality standards. Unless water quality standards are consistent for the same segment of river, one set of state standards by comparison will be less restrictive and in conflict with the opposite side of the river. The guiding principle of the Compact is that no pollution from an individual State shall "injuriously affect" interstate waters. It is the Commission's responsibility to ensure protection for the river and should not sanction a framework that would allow for such inconsistencies and violation of the founding mission of the Commission.
8. The proposed alternatives will unnecessarily complicate the biennial Section 305(b) reports and the 303(d) list for the Ohio River main stem. How will ORSANCO determine which of the state standards will apply for the analyses required by the Clean Water Act? Attempting to address multiple state standards will require more time and analysis to complete these reports for USEPA.
9. A framework for inconsistent standards for the same water body will create confusion and economic harm for the regulated community as they seek to comply with different standards. Additionally, such a framework would also establish a lack of equity among the states in its attempts to regulate discharges to the river. Economic development efforts will be compromised if differing standards are in place for different states.
10. The proposed framework will also generate great confusion for the greater public with the issuance of advisories, both fish advisories and recreational contact advisories. How is the public to interpret an advisory issued on one side of the river but not the other? What is in the best interest of public health? We acknowledge that there are current inconsistencies for fish consumption advisories. There is no discussion in the materials on how this situation has persisted nor how it would be addressed in a future framework with independent state standards.
11. We remain very concerned that the alternative was selected without any criteria used as part of the decision process. If criteria were in fact used, they should be made available to the public. As a public institution, ORSANCO is beholden to an open, transparent review process

congruent with its delegated authorities under federal law.

12. Looking at the totality of the comments provided in January along with the minority report for Alternative #2, clearly there is not overwhelming support for the "preferred" Alternative #2 from those voices within the ORSANCO structure and most familiar with the workings of the PCS program. We question the value of advancing a proposal that has so little support and would result in a fundamental diminishment of water quality protections for the Ohio River.

In summary, forty six years of water program administration under the Clean Water Act has taught us that we need to manage our water bodies as connected systems within drainage boundaries, not disjointed administration separated by jurisdictional boundaries. Any proposal to resort to pollution control oversight within state borders is a step backward. The Compact compels the member states to act on behalf of a water body beyond its jurisdictional waters, a unique role that demands action beyond parochial interests.

Dorothy T. Rush

August 20, 2018

ORSANCO, 5735 Kellogg Avenue, Cincinnati, OH 45230, Attn: PCS Comments.

Emailed to: PCS@orsanco.org.

TO WHOM IT MAY CONCERN:

I am Hank Graddy, Chair of the Sierra Club, Cumberland Chapter (Ky) Water Committee. I have served on the ORSANCO Watershed Organization Advisory Committee (WOAC) in that capacity since that advisory committee was established.

We submitted an earlier version of these comments for the Kentucky Chapter in February, and at the public hearing on July 26, 2018 when we also submitted oral comments. We are now submitting these additional comments in writing within the deadline ORSANCO has provided.

In summary, we believe that setting Ohio River Pollution Control Standards (PCS) is the most important work that ORSANCO performs. If the ORSANCO Board adopts the Alternative 2, to stop setting Pollution Control Standards for the Ohio River, such action calls into question the very purpose of ORSANCO. We have included KRS 224.18-700 Ohio River Valley Water Sanitation Compact at the end of these comments. We read this Kentucky statute as requiring ORSANCO set Pollution Control Standards. Therefore, we read Alternative 2 as a breach of the ORSANCO Compact and a breach of Kentucky law.

The Sierra Club, Cumberland Chapter (Ky) has supported many efforts to improve the water quality of the Ohio River with ORSANCO. Among other actions, the Sierra Club in Kentucky was a founding partner with the Kentucky Waterways Alliance and the Kentucky Division of Water (DOW) Water Watch program to organize and support the Watershed Watch in Kentucky (WWKY) citizen science program, and we have been collecting water quality data across Kentucky since 1997. For several years, WWKY directed a portion of its water testing resources to monitor sampling sites within Kentucky that are tributaries of the Ohio River as part of our Ohio River Action. On occasions, and when resources were available, ORSANCO supported the WWKY data collection. WWKY data can be found at: <http://kgs.uky.edu/wwky/main.htm>

Kentucky Sierra Club members have attended meetings of the US EPA Hypoxia Task Force, learning at one such meeting that the Commonwealth of Kentucky was not a participating state on that task force. The Kentucky Sierra Club complained about this lack of representation and today, the Commonwealth of Kentucky does participate in these meetings.

We submit these additional comments to ORSANCO regarding the 2018 review of ORSANCO's Pollution Control Standards ("PCS"). In its solicitation of comments, ORSANCO indicated that a majority of Commissioners support withdrawing from its role in maintaining, administering, and periodically updating the current Pollution Control Standards. We strongly oppose that proposal and urge ORSANCO to continue in its role as a source of consistent and expert input on appropriate pollution control standards for the Ohio River. We therefore ask the Commission to reject proposed Alternative 2 in favor of an approach that, consistent with Alternatives 3 and 4, allows ORSANCO to continue to apply its expertise and unique interstate perspective to protect and improve water quality for the entire Ohio River.

As noted in summary above and in more detail below, we believe that the action set forth in Alternative 2 is in violation of the ORSANCO Compact and KRS 224.18-760 Ohio River Valley Water Sanitation Compact.

Alternative 2 is also contrary to the 2008 ORSANCO Strategic Plan as follows:

1. In furtherance of the Article I Vision that "all interstate waters of the Ohio River Watershed meet the Compact objectives[,] the second Strategic Objective states that:

"The Commission will develop physical, chemical and biological water quality criteria to protect the desired uses."

2. In furtherance of Article VI of the Compact, the strategic plan notes that: "Article VI of the Compact establishes the Commission's authority to adopt rules, regulations and standards for the treatment of wastes discharged to the interstate waters of the District under the principal (sic) that wastes discharged in one state shall not harm the waters of another state."

The strategic plan offers a vision under Article VI that "all wastewater discharges to interstate waters of the District are provided adequate treatment." The Strategic Objectives for Article VI provide that:

"The Commission will establish and maintain, through periodic review, comprehensive standards for wastewater discharges to the Ohio River."

And

"The Commission will assess the need for additional standards for discharges to interstate tributaries."

3. Finally, the strategic plan notes with respect to Article VII that "the Compact recognizes the states' authorities to adopt more stringent requirements than those of ORSANCO." Were it contemplated in the Strategic Plan that the ORSANCO PCS would be eliminated, this portion of the Strategic Plan would have no meaning due to the lack of ORSANCO standards with which the state's requirements could be compared.

Alternative 2 is contrary to ORSANCO Bylaws, which establish standing committees including the Pollution Control Standards Committee as follows:

“The Pollution Control Standards Committee shall be comprised of six or more members with at least one Commissioner from each of the six states bordering the Ohio River, with the Chairman of the Technical Committee, the Executive Director and Legal Counsel as ex officio non-voting members. *It shall review the Commission’s Pollution Control Standards on a triennial basis and may review specific standards as needed. It shall report its findings to the Commission and recommend actions pursuant to Article VI of the Compact.* Further, the committee shall meet as necessary to review instances of significant non-compliance with the Compact and the Commission’s Water Pollution Control Standards and provide reports and recommendations to the Commission as appropriate. At minimum, prior to the regular October Commission meeting each year, the Pollution Control Standards Committee will review an annual Summary report of the previous (fiscal) years’ activities of non-compliance (sic) wastewater dischargers and provide recommendations to the Commission for appropriate action.”

We have signed on to the letter submitted on Monday, August 20, 2018 by the Environmental Law & Policy Center, (Madeline Fleisher) and the “Environmental Organizations.” We are writing separately to add several concerns and specifics that are unique to Kentucky.

We previously expressed our disappointment in the Kentucky Commissioners, based upon our belief that they had played a leadership role in the advocacy of Alternative 2. We stated that, as such, Deputy Secretary Bruce Scott and Director Peter Goodmann had done a disservice to the Commonwealth of Kentucky.

We are pleased to report that we have now had an opportunity to sit down and discuss these issues with Mr. Scott and Mr. Goodmann and they have corrected our understanding of their role. Mr. Scott and Mr. Goodmann have informed us that they were the authors of the Alternative 5, which would change one sentence in the current Pollution Control Standards, changing Chapter 1: General Provisions, 1.1 Authority and Purpose, paragraph 6 from. *“Specific wastewater discharge requirements are established in these regulations and **must be incorporated** into discharge permits....”* to read, *“Specific pollution control standards are established in these regulations and **shall be considered** when developing discharge permits.....”*

We understand that the Alternative 5 was offered as a compromise and that it would retain the ORSANCO role of setting Pollution Control Standards. We are concerned that this proposed compromise would weaken the effectiveness of the ORSANCO Pollution Control Standards in certain states such as Indiana. However, this Alternative 5 is still far better than Alternative 2.

We are also pleased to report that at our meeting, we all shared a genuine agreement that ORSANCO was very important – vital - to the Commonwealth of Kentucky and to the future of the Ohio River. We shared a commitment to help ORSANCO regain and maintain public support.

One of the ways that ORSANCO can regain and maintain public support is by taking the lead in addressing persistent and newly emerging water pollution problems. Instead of considering Alternative 2, ORSANCO should take the lead in setting numeric nutrient standards for the Ohio River. This need is longstanding and ORSANCO is in the best position to lead. In fact, this exactly what ORSANCO reported that it was working on in the most recent 2017 ORSANCO Annual Report, at pages 14,15:

Nutrient Criteria Development

Excessive nutrients have long been an issue in our nation's waterways, and the Ohio River is no exception. To resolve this issue, ORSANCO staff have been working towards defensible nutrient criteria for the Ohio River for over a decade using nutrient, planktonic algae, and chlorophyll-a....

In 2014, ORSANCO purchased 60 continuous dissolved oxygen loggers to obtain this information that was previously unavailable. Since then, these loggers have been placed alongside the macroinvertebrate samplers in the Belleville, Markland, McAlpine, Olmstead/Open Water, Montgomery, Racine, JT Myers, Willow Island, Greenup, and Cannelton pools in the Ohio River. Additionally, water samples were obtained for nutrient and chlorophyll-a analysis at each of these sites.

ORSANCO staff are currently analyzing the data from this paired study, and early indications are promising that defensible nutrient criteria can be developed from this approach. This study is scheduled to continue during the 2017 field season.

The need is compelling. The 2017 Annual Report discusses current eutrophication problems in the Ohio River at page 15, 16:

Harmful Algal Blooms

Algae are present in the Ohio River throughout the year.....

Cyanobacteria can produce toxins which can be harmful if ingested. For this reason, an algal bloom which consists primarily of cyanobacteria is considered a Harmful Algal Bloom (HAB).....

*On August 19, 2015, ORSANCO received an NRC report of a paint-like green material on the Ohio River at Pike Island Locks and Dam (ORM 84.2), which covered 100 X 200 feet. This was quickly identified as the blue-green algae *Microcystis aeruginosa*. Over the next month, this bloom expanded to cover the Ohio River from Pike Island L&D to Cannelton L&D (ORM 84.2 to 720.7).....*

At the July 26, 2018 public hearing, I submitted a hard copy of the following article concerning the need to set more protective water quality standards from Nitrates:

https://www.circleofblue.org/2018/world/more-evidence-of-nitrate-cancer-risk-in-drinking-water/?mc_cid=28a90de745&mc_eid=19bc36ebb9

This is what ORSANCO should be focused on. This is what the public needs and wants from ORSANCO.

The Sierra Club in Kentucky – and throughout the Ohio River watershed - stands ready to work with ORSANCO to improve and protect the water quality in the Ohio River. We stand ready to help the public better understand what ORSANCO does and does not do. We reaffirm our earlier stated opinion that ORSANCO's role of setting Ohio River Pollution Control Standards is the most important role for ORSANCO. We ask ORSANCO to work with the Sierra Club and the other public voices that spoke on July 26, 2018 – all in strong opposition to Alternative 2. ORSANCO's continued consideration of the very unpopular Alternative 2 does great damage to ORSANCO.

We recognize that the Commonwealth of Kentucky special responsibility for the Ohio River. The Commonwealth of Kentucky has always claimed jurisdiction over the waters of the Ohio River to the water line on the northern boundary. These claims have been upheld by the United States Supreme Court.

See: **KRS 1.200 Boundary with Ohio, Indiana, and Illinois.**

(1) The boundary with Indiana begins at the point on the Ohio River common to the boundary lines for the States of Ohio, Indiana, and the Commonwealth of Kentucky, thence southwesterly, along the boundary line common to the States of Indiana and Kentucky, the boundary line being a series of straight lines between sequentially numbered geodetic points, 1927 North American Datum, as fixed by the Supreme Court of the United States in Kentucky v. Indiana, No. 81, Original, decided November 4, 1985, thence to the point on the Ohio River common to the boundary lines for the States of Indiana, Illinois, and the Commonwealth of Kentucky as described in the case cited above.

(2) The boundary with Ohio begins at the point on the Ohio River common to the boundary lines for the States of Ohio, West Virginia, and the Commonwealth of Kentucky, thence generally northwesterly, northerly, and westerly along the boundary line common to the States of Ohio and Kentucky, the boundary line being a series of straight lines between sequentially numbered geodetic points, 1927 North American Datum, as fixed by the Supreme Court of the United States in Ohio v. Kentucky, No. 27, Original, decided April 15, 1985, thence to the point on the Ohio River common to the boundary lines for the States of Ohio, Indiana, and the Commonwealth of Kentucky as described in the case cited above.

(3) The boundary with Illinois is the low water mark on the northern side of the Ohio River, beginning with the point on the Ohio River common to the boundary lines for the States of Indiana, Illinois, and the Commonwealth of Kentucky, thence due west and downstream with the low water mark on the northern side of the Ohio River, and into the Mississippi River, intersecting a line drawn through the center of the Mississippi.

Where the boundary of the Commonwealth of Kentucky includes the Ohio River, there is great potential for conflict with Kentucky over permits to discharge from Ohio, Indiana and Illinois into the river. ORSANCO prevents that conflict.

From the DOW 2014 Integrated Report to Congress, Volume 1, Page 76:

Of note, the Ohio River mainstem drains all but the Jackson Purchase region of westernmost Kentucky. That over two-thirds of the Ohio River mainstem fully supports the two aquatic life DUs (WAH and OSRW) of that river is an important result. This river ultimately drains the watersheds for every major Kentucky river tributary except the Tennessee River and Mississippi River minor tributaries. Of the 90,961 stream miles in the Commonwealth, the Ohio River tributaries account for 84,462 stream and river miles, or 93 percent of miles that drain the Kentucky landscape.

As the state with the greatest responsibility for the condition of the Ohio, it is Kentucky that needs all the help it can get, from ORSANCO and from the other states that also impact the Ohio and that need and depend on the Ohio River.

While the Commonwealth of Kentucky has a greater responsibility, the Kentucky Division of Water has suffered many years of inadequate funding and staffing, and political will. The Kentucky total maximum daily load backload (CWA TMDL) is huge, and - unless funding and staffing and political will change – unmanageable.

From the 2014 Integrated Report to Congress, Volume I, page 19:

States are now faced with the situation where they are asked to maintain a robust ambient monitoring program to characterize and track conditions of the state's waters (305[b] reporting) and at the same time collect data for TMDL development in hundreds of impaired water bodies and segments, eventually tracking the success of implementation. Like most states, Kentucky's schedule requires hundreds (over 2,500 as of the 2014 IR cycle) of TMDLs be developed. The 2002 303(d) list had 946 pollutant/water body combinations and those TMDLs are scheduled to be developed by 2015. Additional staff, lab resources, and especially contractual monies, must be obtained to accomplish this workload. KDOW is working to establish arrangements to fund TMDL planning, data collection, lab analysis, and development with internal, contractual, and interested third-party resources, including volunteer organizations.

From the 2014 Integrated Report to Congress, Volume II, page 2:

As of May 2012, KDOW has submitted and EPA has approved TMDLs for 313 pollutant/waterbody combinations.

Kentucky currently relies on ORSANCO for the Kentucky 305(b) and 303(e) integrated reports to congress concerning water quality in the Ohio River Main Stem.

From the 2014 Integrated Report to Congress, Volume I, page 2:

The KDOW operates its primary monitoring programs under a five-year rotating watershed management approach implemented in 1998. This IR represents monitoring efforts from the third cycle of the BMU (basin management unit) monitoring strategy; the Green River – Tradewater River BMU is the primary focus in this IR; these BMUs were monitored beginning in April 2011 – March

2012. This report also incorporates assessment data and results from monitoring that occurred during this reporting cycle outside of the BMU of focus; thus providing a statewide update of monitoring results.

Monitoring of the Ohio River mainstem is primarily accomplished by the Ohio River Valley Water Sanitation Commission (ORSANCO).

From the 2014 Integrated Report to Congress, Volume I, page 57:

Historically, the agency deferred to ORSANCO's 305(b) report for the Ohio River, but now takes the associated data and populates the 305(b) assessment results in its ADB submission to EPA.

Kentucky DOW also relies upon ORSANCO methods and standards in other areas. From 2014 Integrated Report to Congress, Volume I, page 89:

The fish community multimetric index (modified Ohio River Fish Index or mORFI_n) derived by ORSANCO and member states is utilized to measure the health of that community and, by extension, the overall health of the biological community as a whole. This index is similar to other multimetric fish indices that have been developed and considers the ecological characteristics of the community, relative 90 condition of the physical habitat, species diversity and composition. Multiple (13) indices are combined to calculate a single score used to determine the condition of that biological community relative to overall water quality. Additional information on the mORFI_n can be obtained from the ORSANCO website at: <http://www.orsanco.org/>.

Kentucky currently sets standards that are specific to the Ohio River Main Stem, in recognition of the standards set by ORSANCO.

401 KAR 10:031. Surface water standards.

Section 9. Water Quality Criteria for the Main Stem of the Ohio River. (1) The following criteria apply to the main stem of the Ohio River from its juncture with the Big Sandy River at River Mile 317.1 to its confluence with the Mississippi River, and shall not be exceeded.

(2) These waters shall be subject to all applicable provisions of 401 KAR 10:001, 10:026, 10:029, 10:030, and this administrative regulation, except for those criteria in paragraphs (a) and (b) of this subsection.

(a) Dissolved oxygen. Instream concentrations shall average at least five and zero-tenths (5.0) mg/L per calendar day and shall not be less than four and zero-tenths (4.0) mg/L except during the April 15 - June 15 spawning season when a minimum of five and one-tenth (5.1) mg/L shall be maintained.

(b) Maximum allowable instream concentrations for nitrite-nitrogen for the protection of human health shall be one and zero-tenths (1.0) mg/L and shall be met at the edge of the assigned mixing zone.

ORSANCO is as needed today as it was in 1948 and in 1972, and that need includes setting, updating and helping to implement pollution control standards for the entire Ohio River.

We read the sections highlighted in yellow to require ORSANCO retain the responsibility to set Ohio River Pollution Control Standards:

KRS 224.18-760 Ohio River Valley Water Sanitation Compact.

The following Ohio River Valley Water Sanitation Compact, which has been negotiated by representatives of the states of Illinois, Indiana, Kentucky, New York, Ohio, Pennsylvania, Tennessee and West Virginia, is approved, ratified, adopted, enacted into law, and entered into by the Commonwealth of Kentucky as a party thereto and signatory state, namely:

OHIO RIVER VALLEY WATER SANITATION COMPACT

Between the States of Illinois, Indiana, Kentucky, New York, Ohio, Pennsylvania, Tennessee and West Virginia

*Pursuant to authority granted by an Act of the 74th Congress of the United States, Public Resolution 104, approved June 8, 1936, conferences of **delegates** appointed to draft the compact were held at Cincinnati, Ohio, on November 20, 1936; January 17, 1938; May 24, 1938; June 13, 1938; October 11, 1938.*

Whereas, A substantial part of the territory of each of the signatory states is situated within the drainage basin of the Ohio River; and

Whereas, The rapid increase in the population of the various metropolitan areas situated within the Ohio drainage basin, and the growth in industrial activity within that area, have resulted in recent years in an increasingly serious pollution of the waters and streams within the said drainage basin, constituting a grave menace to the health, welfare, and recreational facilities of the people living in such basin, and occasioning great economic loss; and

Whereas, The control of future pollution and the abatement of existing pollution in the waters of said basin are of prime importance to the people thereof, and can best be accomplished through the cooperation of the States situated therein, by and through a joint or common agency;

Now, Therefore, The States of Illinois, Indiana, Kentucky, New York, Ohio, Pennsylvania, Tennessee and West Virginia do hereby covenant and agree as follows:

ARTICLE I

Each of the signatory States pledges to each of the other signatory States faithful cooperation in the control of future pollution in and abatement of existing pollution from the rivers, streams and waters in the Ohio River basin which flow through, into or border upon any of such signatory States, and in order to effect such object, agrees to enact any necessary legislation to enable each such State to place and maintain the waters of said basin in a satisfactory sanitary condition, available for safe and satisfactory use as public and industrial water supplies after reasonable treatment, suitable for recreational usage, capable of maintaining fish and other aquatic life, free from unsightly or malodorous nuisances due to floating solids or sludge deposits, and adaptable to such other uses as may be legitimate.

ARTICLE II

The signatory States hereby create a district to be known as the "Ohio River Valley Water Sanitation District," hereinafter called the District, which shall embrace all territory within the signatory States, the water in which flows ultimately into the Ohio River, or its tributaries.

ARTICLE III

The signatory States hereby create the "Ohio River Valley Water Sanitation Commission," hereinafter called the Commission, which shall be a body corporate, with the powers and duties set forth herein, and such additional powers as may be conferred upon it by subsequent action of the respective legislatures of the signatory States or by act or acts of the Congress of the United States.

ARTICLE IV

The Commission shall consist of three commissioners from each State, each of whom shall be a citizen of the State from which he is appointed, and three commissioners representing the United States Government. The commissioners from each State shall be chosen in the manner and for the terms provided by the laws of the States from which they shall be appointed, and any commissioner may be removed or suspended from office as provided by the law of the State from which he shall be appointed. The commissioners representing the United States shall be appointed by the President of the United States, or in such other manner as may be provided by Congress. The commissioners shall serve without compensation, but shall be paid their actual expenses incurred in and incident to the performance of their duties; but nothing herein shall prevent the appointment of an officer or employee of any State or of the United States Government.

ARTICLE V

The Commission shall elect from its number a chairman and vice chairman, and shall appoint, and at its pleasure remove or discharge, such officers and legal, clerical, expert and other assistants as may be required to carry the provisions of this compact into effect, and shall fix and determine their duties, qualifications and compensation. It shall adopt a seal and suitable bylaws, and shall adopt and promulgate rules and regulations for its management and control. It may establish and maintain one or more offices within the District for the transaction of its business, and may meet at any time or place. One or more commissioners from a majority of the member States shall constitute a quorum for the transaction of business.

The Commission shall submit to the Governor of each State, at such time as he may request, a budget of its estimated expenditures for such period as may be required by the laws of such State for presentation to the legislature thereof.

The Commission shall keep accurate books of account, showing in full its receipts and disbursements, and said books of account shall be open at any reasonable time to the inspection of such representatives of the respective signatory States as may be duly constituted for that purpose.

On or before the first day of December of each year, the Commission shall submit to the respective governors of the signatory States a full and complete report of its activities for the preceding year.

The Commission shall not incur any obligations of any kind prior to the making of appropriations adequate to meet the same; nor shall the Commission pledge the credit of any of the signatory States, except by and with the authority of the legislature thereof.

ARTICLE VI

It is recognized by the signatory States that no single standard for the treatment of

sewage or industrial wastes is applicable in all parts of the District due to such variable factors as size, flow, location, character, self-purification, and usage of waters within the District. The guiding principle of this compact shall be that pollution by sewage or industrial wastes originating within a signatory State shall not injuriously affect the various uses of the interstate waters as hereinbefore defined.

All sewage from municipalities or other political subdivisions, public or private institutions, or corporations, discharged or permitted to flow into these portions of the Ohio River and its tributary waters which form boundaries between, or are contiguous to, two or more signatory States, or which flow from one signatory State into another signatory State, shall be so treated, within a time reasonable for the construction of the necessary works, as to provide for substantially complete removal of settleable solids, and the removal of not less than forty-five percent (45%) of the total suspended solids; provided that in order to protect the public health or to preserve the waters for other legitimate purposes, including those specified in Article I, in specific instances such higher degree of treatment shall be used as may be determined to be necessary by the Commission after investigation, due notice and hearing.

All industrial wastes discharged or permitted to flow into the aforesaid waters shall be modified or treated, within a time reasonable for the construction of the necessary works, in order to protect the public health or to preserve the waters for other legitimate purposes, including those specified in Article I, to such degree as may be determined to be necessary by the Commission after investigation, due notice and hearing.

All sewage or industrial wastes discharged or permitted to flow into tributaries of the aforesaid waters situated wholly within one State shall be treated to that extent, if any, which may be necessary to maintain such waters in a sanitary and satisfactory condition at least equal to the condition of the waters of the interstate stream immediately above the confluence.

The Commission is hereby authorized to adopt, prescribe and promulgate rules, regulations and standards for administering and enforcing the provisions of this article.

ARTICLE VII

Nothing in this compact shall be construed to limit the powers of any signatory State, or to repeal or prevent the enactment of any legislation or the enforcement of any requirement by any signatory State, imposing additional conditions and restrictions to further lessen or prevent the pollution of waters within its jurisdiction.

ARTICLE VIII

The Commission shall conduct a survey of the territory included within the District, shall study the pollution problems of the District, and shall make a comprehensive report for the prevention or reduction of stream pollution therein. In preparing such report, the Commission shall confer with any national or regional planning body which may be established, and any department of the Federal Government authorized to deal with matters relating to the pollution problems of the District. The Commission shall draft and recommend to the governors of the various signatory States uniform legislation dealing with the pollution of rivers, streams and waters and other pollution problems within the District. The Commission shall consult with and advise the various States, communities, municipalities, corporations, persons or other entities with regard to particular problems

connected with the pollution of waters, particularly with regard to the construction of plants for the disposal of sewage, industrial and other waste. The Commission shall, more than one month prior to any regular meeting of the legislature of any State which is a party thereto, present to the governor of the State its recommendations relating to enactments to be made by any legislature in furthering the intents and purposes of this compact.

ARTICLE IX

The Commission may from time to time, after investigation and after a hearing, issue an order or orders upon any municipality, corporation, person, or other entity discharging sewage or industrial waste into the Ohio River or any other river, stream or water, any part of which constitutes any part of the boundary line between any two or more of the signatory States or into any stream any part of which flows from any portion of one signatory State through any portion of another signatory State. Any such order or orders may prescribe the date on or before which such discharge shall be wholly or partially discontinued, modified or treated or otherwise disposed of. The Commission shall give reasonable notice of the time and place of the hearing to the municipality, corporation or other entity against which such order is proposed. No such order shall go into effect unless and until it receives the assent of at least a majority of the commissioners from each of not less than a majority of the signatory states; and no such order upon a municipality, corporation, person or entity in any State shall go into effect unless and until it receives the assent of not less than a majority of the commissioners from such State. It shall be the duty of the municipality, corporation, person or other entity to comply with any such order issued against it or him by the Commission, and any court of general jurisdiction or any United States district court in any of the signatory States shall have the jurisdiction, by mandamus, injunction, specific performance or other form of remedy, to enforce any such order against any municipality, corporation or other entity domiciled or located within such State or whose discharge of the waste takes place within or adjoining such State, or against any employee, department or subdivision of such municipality, corporation, person or other entity; provided, however, such court may review the order and affirm, reverse or modify the same upon any of the grounds customarily applicable in proceedings for court review of administrative decisions. The Commission or, at its request, the Attorney-General or other law enforcing official, shall have power to institute in such court any action for the enforcement of such order.

ARTICLE X

The signatory States agree to appropriate for the salaries, office and other administrative expenses, their proper proportion of the annual budget as determined by the Commission and approved by the Governors of the signatory States, one-half of such amount to be prorated among the several States in proportion to their population within the District at the last preceding federal census, the other half to be prorated in proportion to their land area within the District.

ARTICLE XI

This compact shall become effective upon ratification by the legislatures of a majority of the States located within the District and upon approval by the Congress of

the United States; and shall become effective as to any additional States signing thereafter at the time of such signing.

The Commonwealth of Kentucky consents that the State of Virginia may become a party to and a signatory state of the aforesaid compact as fully as if it had been expressly named therein.

Effective: October 1, 1942

History: Recodified 1942 Ky. Acts ch. 208, sec. 1, effective October 1, 1942, from Ky. Stat. sec. 4286b-1.

Formerly codified as KRS 224.190, and also previously codified as KRS 220.550.

Thank you for this opportunity to comment.

Subject: PCS comments - amended Environmental Organization comments
Date: Monday, August 20, 2018 5:08:55 PM

See below resubmitted comments, with Ohio River Foundation included as a signatory:

To Whom It May Concern:

The Environmental Law & Policy Center, Food & Water Watch, Izaak Walton League of America - Indiana Division, Izaak Walton League of America - Ohio Division, Kentucky Waterways Alliance, Lower Ohio River Waterkeeper, Ohio River Foundation, Ohio Valley Environmental Coalition, Prairie Rivers Network, River Fields, Cumberland Chapter (Ky.) Sierra Club, Sierra Club Hoosier Chapter, Sierra Club Illinois Chapter, Sierra Club Ohio Chapter, Valley Watch, and West Virginia Rivers Coalition (collectively, "Environmental Organizations"), submit these supplemental comments to the Ohio River Valley Water Sanitation Commission ("ORSANCO") regarding the 2018 review of ORSANCO's Pollution Control Standards ("PCS"). As set forth in initial comments submitted in February 2018, the Environmental Organizations strongly oppose ORSANCO's proposed revisions to the PCS, which would eliminate consistent, river-wide water quality standards for the Ohio River and instead leave protection of its water quality to individual states along its 981 mile length. We include the initial Environmental Organization comments submitted on February 23, 2018, as an appendix for reference, rather than reiterating the same points here.

These supplemental comments focus on providing new information we have developed since the initial review period. A central assumption of ORSANCO's initial discussion of this proposal was that the ORSANCO PCS are redundant and unnecessary in light of state regulation under the Clean Water Act – despite information showing that the ORSANCO standards in many cases are more protective than state standards alone. **That assumption is not correct.** Our own investigation has shown that ORSANCO's Pollution Control Standards **do** result in Clean Water Act permits that provide more protection for water quality in the Ohio River than state standards alone, particularly for states like Indiana or Pennsylvania that expressly apply the ORSANCO PCS where they are more stringent than state water quality criteria.

Eliminating the PCS could therefore result in lower water quality for the river going forward, such as by lowering safeguards against ammonia and bacterial discharges that can compromise drinking water and recreational uses of the Ohio River. We therefore urge ORSANCO to reject the pending proposal to eliminate the PCS outright, and instead consider a tailored approach that would continue ORSANCO's role of providing uniform protection for the Ohio River and a mechanism to address the unique potential for interstate water quality problems with a river that flows through six states and receives discharges from hundreds of facilities.

A. The 2018 Pollution Control Standards Proposal

The proposed language for the 2018 revision of ORSANCO's Pollution Control Standards provides:

Because all states are mandated by the federal Clean Water Act to adopt and submit for USEPA approval a program that addresses designated uses, free from mandates, wastewater discharge requirements, water quality standards, mixing zones, and more, the Commission has concluded that the requirements of the Compact are being satisfied by member state programs implementing the federal Clean Water Act. The Commission has also concluded that all of its member states are implementing programs approved under the federal Clean Water Act for the safe and satisfactory uses of the Ohio River as public and industrial water supplies after reasonable treatment, suitable for recreational usage, capable of maintaining fish and other aquatic life, and that therefore the requirement of the Compact are being satisfied by member states through these programs. Given the fact that all member states are implementing approved programs under the federal Clean Water Act, the Commission will discontinue the triennial review process of updating the PCS rules. By proceeding under this approach the Commission is confident that public will have the full and complete protection of the federal Clean Water Act and the oversight of USEPA and the states without the redundancy of the current PCS program.

This proposal rests on two key assumptions: first, that the ORSANCO PCS are "redundan[t]" in light of existing state water quality protections under the Clean Water Act; and second, that the federal Clean Water Act will continue to be sufficient to protect water quality in the Ohio River.

B. ORSANCO's Pollution Control Standards Do Provide Unique Protections for Ohio River Quality That Are Not Duplicated by State Clean Water Act Standards.

As shown in ORSANCO's own analysis prior to the initial comment period for the 2018 PCS process, there are a number of pollutants for which the ORSANCO standard is filling in a gap in state standards or providing a more protective standard. See Detailed Compilation of ORSANCO PCS vs USEPA and Mainstem States Water Quality Standards, *available at* <http://www.orsanco.org/2018-pollution-control-standards>. This analysis raised the key question of whether ORSANCO's additional or more stringent standards in fact provide more protection for water quality in the Ohio River. We know that some states, such as Indiana and Pennsylvania, explicitly rely on ORSANCO standards where they provide necessary protection for Ohio River water quality above and beyond the state's water quality criteria. See, e.g., 327 Indiana Admin. Code 5-2-10(a)(4)(c); 25 Pennsylvania Admin. Code § 93.9(b) (also incorporating criteria from the Delaware River Basin Commission and the Great Lakes Water Quality Agreement). We have therefore attempted to survey at least some of the individual Clean Water Act permits for facilities that discharge to the Ohio River, and have found that there are some pollutants, such as ammonia and fecal coliform/E. coli, where the ORSANCO standards are – as a practical matter – providing important protections for the Ohio River.

For purposes of this analysis, we examined publicly available Clean Water Act permits and permitting documents for facilities with the Ohio River as their receiving waters. There are approximately 900 such facilities based on a search of the U.S. Environmental Protection Agency's PCS-ICIS system (<https://www.epa.gov/enviro/pcs-icis-search>). We were not able to review all of these permits, in large part because the state agencies responsible for issuing the permits do not make the documents readily available to the public. Thus, we have been able to review only a handful of permits for facilities in West Virginia and Kentucky, while more comprehensively searching permits for facilities in states like Indiana and Ohio that provide access through their state environmental agency websites.

Despite the limitations on our ability to conduct a comprehensive review, we found more than 20 examples where states are in fact applying ORSANCO's Pollution Control Standards to reduce harmful pollution discharges to the Ohio River. These include permits or other permitting documents showing that regulators have looked to the PCS to set permit limits:

Pennsylvania

- PA0002208 - Shell Chemical Appalachia Petrochemicals Complex: ORSANCO PCS for temperature

West Virginia

- WV0004499 - Mountain State Carbon: ORSANCO PCS for Ammonia-N, temperature

Ohio

- OH0025453 - Little Miami W Wastewater Treatment Plant WTP: ORSANCO PCS for E. coli
- OH0025470 - Muddy Creek Wastewater Treatment Plant: ORSANCO PCS for E. coli
- OH0024970 - City of East Liverpool Wastewater Treatment Plant: ORSANCO PCS for E. coli
- OH0028762 - General James M. Gavin Plant: ORSANCO PCS for E. coli

Kentucky

- KY0004049 - Paducah Gaseous Diffusion Plant: ORSANCO PCS for acute ammonia criterion
- KY0107000 - Cash Creek Generation Station: ORSANCO PCS for acute ammonia criterion

Indiana

- IN0002101 – Sabic Innovative Plastics: ORSANCO PCS standard for copper and others
- IN0002259 - SIGECO F.B. Culley Generating Station: ORSANCO PCS for mercury (water column)
- IN0002470 - CountryMark Refining & Logistics, LLC: ORSANCO PCS for Ammonia-N and fluoride
- IN0020231 - Town of Vevay Wastewater Treatment Plant: ORSANCO PCS for fecal coliform, summer Ammonia-N
- IN0020508 - City of Charlestown Wastewater Treatment Plant: ORSANCO PCS for fecal coliform, summer Ammonia-N
- IN0021067 - City of Rockport South Wastewater Treatment Plant: ORSANCO PCS for fecal coliform, summer Ammonia-N
- IN0021121 - Town of Leavenworth Wastewater Treatment Plant: ORSANCO PCS for fecal coliform, summer Ammonia-N
- IN0024431 - City of Rising Sun Wastewater Treatment Plant: ORSANCO PCS for E. coli. Ammonia-N
- IN0032956 - City of Evansville West Wastewater Treatment Plant: ORSANCO PCS for fecal coliform
- IN0052191 - SIGECO A.B. Brown Generating Station: ORSANCO PCS for mercury (water column)
- IN0056391 - Town of Patriot Wastewater Treatment Plant: ORSANCO PCS for fecal coliform, summer Ammonia-N
- IN0059781 - Caesars Riverboat Casino Wastewater Treatment Plant: ORSANCO PCS for Ammonia-N

Illinois

- IL0004081 – LaFarge Midwest Joppa Plant: ORSANCO PCS for Total Suspended Solids, BOD5, E. Coli
- IL0004421 – Honeywell – Metropolis Works Facility: ORSANCO PCS for temperature, Total Suspended Solids, E. coli

These permits offer direct evidence that ORSANCO's Pollution Control Standards are vital to protect the Ohio River and its designated uses. The fecal coliform and E. coli limits in the above permits are important given the Ohio River's a long history of bacterial pollution impairing its use for contact recreation. The continued existence and application of ORSANCO's bacterial standards is vital to resolving this serious problem.

A number of the above permits also contain PCS-based limits on ammonia discharges that, as noted in the Water Users Advisory Committee comments, can otherwise disrupt drinking water treatment processes. *See also* American Water Works Association, Ammonia Fact Sheet, <https://www.awwa.org/Portals/0/files/resources/water%20knowledge/rc%20small%20systems/AWWA's%20Ammonia%20Fact%20Sheet.pdf>. Although the Clean Water Act contains some "anti-backsliding" protections against loosening existing permit limits, it is unclear how they would apply if ORSANCO were to eliminate the PCS going forward. That issue is certainly likely to arise in a number of permit renewal proceedings, consuming time and resources regardless of the outcome. Accordingly, ORSANCO's proposed withdrawal of the PCS could well cause immediate harm to people's ability to use and rely on clean, safe water in the Ohio River.

It is also clear that ORSANCO's PCS have played an important role in protecting the river's water quality in the past, in ways that illustrate the importance of keeping the standards in place going forward. For example, the Indiana Culley and Brown coal plants apparently previously installed additional treatment technology to lower their mercury discharges to meet the ORSANCO water column limit. *See* Vectren Energy Deliver of Indiana, 2016 Integrated Resource Plan at 257, *available at* https://iurc.portal.in.gov/_entity/sharepointdocumentlocation/a1198d07-b81e-e711-8121-1458d04ecfb0/bb9c6bba-fd52-45ad-8e64-a444aef13c39?file=44927_Vectren%20South_No%201%20Direct%20Testimony%20and%20Attachments_Harris_041017.pdf. While the 2015 PCS revisions allow for waivers from application of ORSANCO's mercury standard, there continue to be fish tissue samples from the river showing methylmercury above levels safe for human consumption, especially in the lower reaches downstream of multiple mercury dischargers. Should that contamination worsen, ORSANCO might revisit these waivers and resume its role in driving reduction of mercury pollution in the Ohio River.

Could such emerging and evolving pollution problems be addressed through state-by-state and permit-by-permit efforts? Perhaps, but not without significant efforts by regulators, citizens, and environmental organizations such as ourselves that may be much less likely to occur

consistently and comprehensively outside the PCS review process. As noted in several sets of comments on the initial version of this proposal, there are contaminants besides mercury – such as TDS and selenium limits, numeric nutrient criteria, Clean Water Act section 305(b) assessments, and others where the PCS provide the most streamlined and consistent way to address water quality issues along the full length of the Ohio River.

C. Consistent Standards for a Single Water Body Have Been Important to Protect Water Quality in Other Watersheds.

A handful of comments from industry imply that ORSANCO's role in setting pollution standards for the entire Ohio River is a national outlier that serves no real function and merely duplicates state regulation under the Clean Water Act. However, a regional approach to addressing water quality problems has been both necessary and successful in other watersheds even in the present day. One useful example is the Delaware River Basin Commission ("DRBC"), a regional state-federal commission that, like ORSANCO, has the authority to set uniform water quality standards for its entire watershed. *See* Delaware River Basin Commission, About DRBC, <https://www.state.nj.us/drbc/about>.

The DRBC has been able to use this authority to set regional water quality standards spurring effective reductions in levels of contaminants such as PCBs and bacteria. *See* DRBC, Delaware River Water Quality: A Brief Recap, <https://www.state.nj.us/drbc/quality>; Gerald J. Kauffman Jr., The Delaware River Revival: Four Centuries of Historic Water Quality Change From Henry Hudson to Benjamin Franklin to JFK, *Pennsylvania History: A Journal of Mid-Atlantic Studies*, Volume 77, Number 4, Autumn 2010, pp. 432-465, available at <http://www.wrc.udel.edu/wp-content/Research/The%20Delaware%20River%20Revival%20G%20J%20Kauffman%202010.pdf>. Now the DRBC is considering how to best address nutrient pollution issues. DRBC, Nutrients, <https://www.state.nj.us/drbc/quality/conventional/nutrients-monitoring.html>. Like ORSANCO, one approach the DRBC is considering is to set appropriate phosphorus and nitrogen levels for the Delaware River Basin.

Regional frameworks such as these are especially important because, as noted in our initial comments submitted on February 23, 2018, the Clean Water Act lacks a strong mechanism for addressing pollution problems across state boundaries. The DRBC has provided a successful supplement to the Clean Water Act in this respect. ORSANCO can similarly rely on the PCS to deal with the Ohio River's own pollution problems as they emerge, but only if the Commission rejects the proposal to eliminate the PCS altogether.

D. Conclusion

As summarized in our initial comments and these supplemental comments, the proposal to eliminate ORSANCO's Pollution Control Standards is not benign. The PCS are not redundant; they do play an important role in protecting the Ohio River by ensuring uniform protection of water quality and providing a level playing field for dischargers up and down the river. Any attempt to replicate those protections through state-by-state and permit-by-permit efforts will inevitably consume significant time and resources and in the end likely prove less effective. Therefore, ORSANCO should reject the proposed elimination of the PCS and maintain its role in providing consistent, coordinated water quality standards for the full length of the Ohio River.

Sincerely,

/s/ Madeline Fleisher

Appendix: February 23, 2018 Initial Environmental Organization Comments

To Whom It May Concern:

The Environmental Law & Policy Center, Hoosier Environmental Council, Kentucky Waterways Alliance, Lower Ohio River Waterkeeper, Ohio Environmental Council, Ohio River Foundation, Ohio Valley Environmental Coalition, Sierra Club Cumberland Chapter (Kentucky), Sierra Club Hoosier Chapter, Sierra Club Ohio Chapter, Three Rivers Waterkeeper, Valley Watch, and West Virginia Rivers Coalition

(collectively, “Environmental Organizations”), submit these comments to the Ohio River Valley Water Sanitation Commission (“ORSANCO”) regarding the 2018 review of ORSANCO’s Pollution Control Standards (“PCS”). In its solicitation of comments, ORSANCO indicated that a majority of Commissioners support withdrawing from its role in maintaining, administering, and periodically updating the current Pollution Control Standards. The Environmental Organizations strongly oppose that proposal and urge ORSANCO to continue in its role as a source of consistent and expert input on appropriate pollution control standards for the Ohio River. We therefore ask the Commission to reject proposed Alternative 2 in favor of an approach that, consistent with Alternatives 3 and 4, allows ORSANCO to continue to apply its expertise and unique interstate perspective to protect water quality for the entire Ohio River.

I. BACKGROUND

A. ORSANCO’s History and Authority

The Ohio River flows almost a thousand miles through six states, with more states included in its drainage basin. In 1948, eight of those states – Illinois, Indiana, Kentucky, New York, Ohio, Pennsylvania, Virginia, and West Virginia – signed the interstate compact that created ORSANCO and established the commitment of those states to “enact any necessary legislation to enable each such State to place and maintain the waters of said basin in a satisfactory sanitary condition, available for safe and satisfactory use as public and industrial water supplies after reasonable treatment, suitable for recreational usage, capable of maintaining fish and other aquatic life, free from unsightly or malodorous nuisances due to floating solids or sludge deposits, and adaptable to such other uses as may be legitimate.” The Compact provides ORSANCO with authority to promulgate rules and issue orders to ensure that “[a]ll industrial wastes discharged or permitted to flow into the aforesaid waters shall be modified or treated, within a time reasonable for the construction of the necessary works, in order to protect the public health or to preserve the waters for [these uses] . . . to such degree as may be determined to be necessary by the Commission after investigation, due notice and hearing.”

As early as 1949, ORSANCO began putting in place water treatment standards to carry out this obligation. In 1972, Congress enacted the “Clean Water Act” (“CWA”) as we know it today, and in 1984 ORSANCO revised its standards to mirror the Clean Water Act structure of designated uses, water quality criteria to protect those uses, and effluent limitations (including mixing zone requirements and a variance procedure). ORSANCO has since reviewed and updated these Pollution Control Standards every three years.

B. The 2018 Pollution Control Standards Proposal

In 2014, ORSANCO established the Ad Hoc Committee on Water Quality Standards Implementation to review how the Pollution Control Standards were being implemented. In 2015 ORSANCO directed the committee to evaluate options relating to ORSANCO’s future role in setting water quality standards. The committee subsequently formulated five alternative proposals for ORSANCO’s role going forward. These alternatives can be grouped into two categories, with Alternatives 1, 2 and 5 calling for a markedly reduced role and Alternatives 3 and 4 calling for a more focused application of ORSANCO’s current standard-setting approach. These five alternatives, and the relevant considerations for each, are described in ORSANCO’s Water Quality Standards Alternative Summary.

Alternative 1 would “[e]liminate the Pollution Control Standards Program and defer to the requirements of the Clean Water Act and member state water quality regulations.” The considerations listed in favor of this alternative are that it would potentially “free up resources” to be reprogrammed to other ORSANCO activities, and would also avert the problem that at least one Ohio River state cannot adopt ORSANCO’s Pollution Control Standards by reference.

Alternative 2 would suspend the triennial review process for the Pollution Control Standards and deem all states in compliance with the Standards to the extent they are implementing approved programs under the federal Clean Water Act. The description of this alternative presumes that the Pollution Control Standards are redundant and that resources currently dedicated to the PCS could be “redirected to other Commission activities” such as “assessments of the water quality and biological integrity of the water, public out-reach, spill detection and response.”

Alternative 3 would “[u]tilize a cost effective approach to finalize uniform WQS rules for the Ohio River by tasking ORSANCO to take the lead in order to eliminate duplication of efforts among six states and save resources. Also, as a starting point, utilize work done by USEPA to develop WQS to avoid conducting basic research.” This proposal would be aimed at protecting water quality and promoting consistency among states, while reducing the overall costs of developing water quality standards and allowing states flexibility to adopt alternative standards when appropriate. It would also enable ORSANCO to continue carrying out the work plan requirements for its section 106 grant from U.S. EPA, which currently includes development of numeric pollution control standards for the Ohio River and constitutes 50% of ORSANCO’s budget.

Alternative 4, similar to Alternative 3, would focus on harmonizing water quality standards across the Ohio River. ORSANCO would look at “standards on an individual basis as warranted,” to ensure coordinated implementation to “restore and maintain the quality of and protect uses of the Ohio River.” This approach would be carried out by the NPDES Committee, working with staff and member states on permitting and certification processes “with a goal of assuring that protection and achievement of pollution controls needed to maintain those uses occurs throughout the Ohio River system.” Even where a state has not formally adopted an ORSANCO standard, the Commission will work with the state so that any permit “achieves a comparable level of protection of the designated uses.”

Finally, Alternative 5 would alter the nature of the PCS, from binding standards to simple recommendations that member states should consider in developing and issuing permits. This alternative rests on the proposition that “the process of promulgating the PCS is redundant of member states’ triennial review of water quality standards.”

ORSANCO has identified Alternative 2 as its “preferred alternative” for consideration in the 2018 PCS review.

II. DISCUSSION

The Commission’s preference for Alternative 2 appears to rest on two primary grounds: first, that it will save resources for ORSANCO to eliminate the Pollution Control Standards from its workload; and second, that the Pollution Control Standards do not serve a significant function in protecting the Ohio River. Neither of these rationales has been adequately explored or supported with detailed facts.

It is entirely reasonable for ORSANCO to be concerned about making the most of its limited financial resources. However, in considering the best use of those resources, it is important to keep in mind that the ORSANCO Pollution Control Standards play an important role in preserving state resources by allowing standards for at least some pollutants, as well as the overall assessment of whether the Ohio River is suffering any serious water quality problems, to be dealt with across the entire river rather than on a state-by-state basis. If ORSANCO were to eliminate the PCS, Ohio River states might well be worse off in the long run without an efficient forum for establishing and updating standards for all pollutants, and an irreplaceable venue for determining a river-wide approach to particularly problematic pollutants.

A. Individual Pollutants

ORSANCO has provided summary-level data from a 2015 staff survey of state water quality standards versus ORSANCO's Pollution Control Standards, which shows that there are significant discrepancies among state standards. While Alternative 2 presumes that these discrepancies are meaningless and that the PCS and state water quality standards are redundant, that presumption is not backed up by any factual analysis. Moreover, Alternative 2 also assumes that if the PCS were eliminated, ORSANCO could redirect the resources used to maintain the PCS with no adverse effects on ORSANCO or its member states. That reasoning likewise lacks any detailed foundation.

1. The Problem of State-ORSANCO Disparities

The ORSANCO analysis indicates that, for the pollutants compared as of 2015:

- There are 188 instances in which ORSANCO has criteria but a member state environmental agency does not;
- There are 252 instances in which member state agencies have parameters that are more than 10% less stringent than ORSANCO's criteria;
- There are 405 instances in which the member state agencies are within 10% of, or more stringent than, the ORSANCO criteria.
- There are 342 instances in which the member state has criteria but ORSANCO does not.

In other words, based on this survey there are 440 pollutants for which the ORSANCO standard is either more stringent than a member state standard or there simply is no state standard. By comparison, there are 747 instances where the state standard is more stringent than or equivalent to the ORSANCO standard, or ORSANCO lacks a standard for the relevant pollutant. Overall, this represents 1187 points of comparison, with 440 – or almost 40% -- where the ORSANCO standard is filling in a gap in state standards or providing a more protective standard.

ORSANCO provided tables containing the information underlying this comparison on February 20, 2018, four days before the deadline for comment, and therefore we have not undertaken a thorough analysis of individual water quality criteria. However, even an initial survey of the data shows that there are concerning inconsistencies and gaps among the state standards. For example, the human health criteria table shows that as of 2015, Ohio and Kentucky both had limits of 10 micrograms per liter for arsenic – significantly higher than ORSANCO's 0.1 microgram per liter criterion. Similarly, Indiana and Ohio both apparently have criteria for polychlorinated biphenyls ("PCBs") that are less stringent than ORSANCO's, which is particularly notable given that the Ohio River's fish consumption use is partially impaired by PCB contamination. While the explanation for these discrepancies is unknown, it shows that some states' standards are not as protective as those in other Ohio River states. Without an ORSANCO standard providing uniformity, there is potential for polluting industries to migrate to states with less restrictive criteria, leaving those states downstream or across the river to deal with their pollution without gaining any of the economic benefits.

The Clean Water Act does not provide an efficient tool for states to address such discrepancies on their own. The Supreme Court confirmed in *Arkansas v. Oklahoma*, 503 U.S. 91 (1992), that the U.S. Environmental Protection Agency ("U.S. EPA") has the authority to consider effects on other states water quality standards when reviewing draft permits under Clean Water Act section 402, 33 U.S.C. § 1342. However, that authority must be applied on a permit-by-permit basis, and is discretionary with U.S. EPA, meaning that policing of interstate discharges through this mechanism would be an onerous and potentially sporadic process without any certain outcome. ORSANCO's authority to set prospective, uniform standards for the Ohio River is a unique tool not available under the Clean Water Act. Even to the extent states do not directly incorporate the ORSANCO PCS into their water quality criteria, but rather apply them to individual sources through the state permitting process, that is still an improvement over the cumbersome and likely ineffective process available under the CWA.

In addition to inconsistent standards, there are some standards where – at least according to the ORSANCO survey – the states have simply left it to ORSANCO to establish criteria. These include gross total alpha, copper, cyanide, fluoride, methylmercury, nitrites, and others. If ORSANCO were to eliminate its Pollution Control Standards, states without standards for those pollutants would presumably have to expend time and resources on filling in those gaps to ensure protection of their portions of the Ohio River.

Overall, this comparison suggests that the ORSANCO standards play a central role in ensuring consistent and up-to-date pollution standards for the Ohio River. Meanwhile, the current proposal provides no estimate, or even description, of what state work would be necessary to make up for the absence of the PCS if they were eliminated. Comments from the POTW Advisory Committee underline this concern, with one commenter pointing out that: "During this time of 'stressed' budgets and limited resources, duplication of efforts is definitely a major concern of many organizations at all levels of government (federal, state and local), as well as the public (tax/rate payers) that we serve. Under any future scenario that minimizes PCS activities, it will be important for ORSANCO to continue to provide a forum to discuss water quality standards and to promote consistency among the states to ensure the protection of the Ohio River as a shared resource." A significant problem with Alternative 2, or any approach that eliminates periodic consideration of river-wide water quality criteria, is the danger that in the absence of ORSANCO standards, inconsistencies will arise without such an adequate forum.

2. The Value of River-Wide Water Quality Criteria

As discussed above, there are clearly significant inconsistencies among state standards for the Ohio River that bear further investigation before ORSANCO can draw any conclusions about the potential costs for states to make up for the loss of the PCS. Meanwhile, the affirmative value of river-wide criteria is clear. There have already been a number of instances where ORSANCO's Pollution Control Standards have and will continue to play an important role in protecting water quality in the Ohio River.

For example, over the last decade ORSANCO has acted to address a growing concern with levels of Total Dissolved Solids ("TDS") in the

Ohio River, by using an expedited PCS process in 2012 to reinstate a (previously eliminated) limit of 500 mg/L at drinking water intakes in order to protect drinking water quality. ORSANCO staff have subsequently conducted valuable research regarding background levels of TDS in order to support translation of that standard into appropriate permit limits. See ORSANCO, Characterization of Dissolved Solids in the Ohio River and Selected Tributaries (Feb. 2014), available at <http://www.orsanco.org/wp-content/uploads/2016/12/Characterization-of-Dissolved-Solids-in-the-Ohio-River-and-Selected-Tributaries.pdf>. This is an instance where ORSANCO, because of its triennial PCS review process, was well-positioned to react swiftly to a unique Ohio River problem and provide drinking water protection along the entire river, backed up by sound science and expertise. Without the PCS process, it is not clear when affected states – themselves facing budget constraints – might have dealt with this problem and what resources they might have to use to do so. The Water Users Advisory Committee comments similarly identify pollutants such as ammonia, E. coli, temperature, and others as ones where ORSANCO's standards provide important, uniform water quality protection across the entire Ohio River to the benefit of states as well as their citizens.

Even where addressing a given pollutant is simply a matter of adopting water quality criteria issued by U.S. EPA, ORSANCO can do so efficiently in order to bring the PCS up-to-date for the entire Ohio River at one time. As one example, ORSANCO has repeatedly indicated its readiness to adopt an updated U.S. EPA aquatic life criterion for selenium. Now that the federal criteria have been issued (in summer 2016), ORSANCO can do so. Notably, some states will not be conducting triennial reviews in which they would address this development for some time – for instance, West Virginia adopted fish tissue limits based on the draft criteria in 2016, but apparently will not address the water column limits in the final criterion until its next triennial review in 2020. By addressing this issue in its 2018 PCS review, ORSANCO will ensure those additional protections are in place significantly earlier. Moreover, in addressing this and other federal criteria, ORSANCO can determine on a river-wide basis whether those criteria are appropriate for the Ohio River rather than leaving individual member states to do so, with potentially disparate results.

Looking ahead, there are emerging pollution issues where ORSANCO's PCS may similarly provide an important avenue to bring the expertise of Commission staff to bear on preserving water quality across the entire Ohio River. In recent years, ORSANCO has been engaged in trying to determine a numeric criterion for nutrient pollution in the Ohio River. This work is timely given that a massive algal bloom occurred on the river in the summer of 2015, and studies show climate change is driving temperature and precipitation changes that may increase the frequency and severity of such algae outbreaks. U.S. Army Corps of Engineers, OHIO RIVER BASIN– Formulating Climate Change Mitigation/Adaptation Strategies through Regional Collaboration with the ORB Alliance 47 (May 2017), available at http://www.corpsclimate.us/docs/USACE%20Ohio%20River%20Basin%20CC%20Report_MAY%202017.pdf. Although ORSANCO's analysis has not yet identified an appropriate numeric criterion, this is a looming threat to the drinking water, recreation, and aquatic life uses of the Ohio River that ORSANCO cannot ignore. Moreover, as shown in ORSANCO's efforts to date, the Commission's staff has the relevant expertise to adequately and efficiently address this complex issue on a river-wide basis. The alternative might well be for states to waste resources as the question of numeric nutrient limits comes up on a state-by-state or even permit-by-permit basis.

Finally, ORSANCO is currently considering a study of the bioaccumulative pollutants Perfluorooctanoic Acid ("PFOA") and Perfluorooctane Sulfonate ("PFOS"), initially identified as of potential concern in a 2010 report on emerging contaminants (<http://www.orsanco.org/wp-content/uploads/2017/01/A-Screening-Study-Investigating-the-Presence-of-Emerging-Contaminants-within-the-Ohio-River-Basin.pdf>). Recently, as noted in ORSANCO's October 2017 TEC meeting minutes, PFOA contamination of drinking water in the Ohio River watershed has been the subject of significant litigation, and U.S. EPA has released health advisory levels for both contaminants. Although PFOA and PFOS are being largely phased out, replacement chemicals with similar properties may continue to pose a threat to Ohio River water quality. Once ORSANCO determines the scope and seriousness of this issue, it may well be appropriate to address this type of pollution through the PCS.

We could list many more instances of ORSANCO's valuable work in connection with the Pollution Control Standards. However, these examples are sufficient to highlight the key questions that Alternative 2 fails to address:

- Will eliminating the Pollution Control Standards actually significantly reduce ORSANCO's workload? A number of the efforts above, although occurring in conjunction with ORSANCO's PCS reviews, fall within its larger mission of providing expert scientific monitoring and analysis of water quality issues in the Ohio River. If the PCS were not in place, it seems likely that ORSANCO would still have a role to play in addressing issues such as identification of numeric nutrient criteria or analysis of total dissolved solid levels. Absent a detailed consideration of what work ORSANCO could in fact abandon if the PCS were eliminated, the answer to this question is unclear.
- If eliminating the PCS does truly reduce ORSANCO's activities, will it simply shift work to ORSANCO member states? For pollutants like Total Dissolved Solids, there is a clear need for a limit and analysis of how to apply that limit to sources. ORSANCO is currently providing that information in the context of the PCS. Eliminating that standard, or precluding ORSANCO from adopting such standards in the future, may simply force each state to individually duplicate the Commission's work while introducing the possibility of more disparities among water quality criteria the Ohio River states. As several other commenters have noted, this shift in workload may also result in a commensurate reduction in federal or other funding.
- Will adopting Alternative 2 prevent ORSANCO from addressing emerging pollution issues in a timely manner? Although the Commission could technically resume its role in setting standards, the regular triennial review process encourages all stakeholders to actively consider and address whether existing standards are adequately protecting the Ohio River's water quality. Without that forum for consideration of both urgent problems like TDS and developing issues like nutrient pollution, inadequate or disparate state-level regulation could easily go unaddressed.
- Are there opportunities to increase the efficiency of the PCS process without eliminating ORSANCO's standards altogether? As noted above, there are a number of pollutants for which the PCS and state standards are similar, as well as a number where there are significant differences. We are sensitive to ORSANCO's concerns regarding whether its PCS work is redundant to ongoing state activities under the Clean Water Act. One sensible way to potentially streamline the PCS reviews would be to focus on promoting uniform standards across the Ohio River, especially for pollutants where U.S. EPA has not provided any federal criteria. This would essentially be a combination of Alternatives 3 and 4.

These significant unanswered questions show that the preference for Alternative 2 is not based on a sufficient exploration of the important issues involved in potentially eliminating a role that ORSANCO has played for decades. Fundamentally, we believe that the current PCS

process is in fact efficient and focused on the areas where ORSANCO is needed most. Nevertheless, if ORSANCO does decide to refine its approach to the PCS, we urge the Commission to ensure it avoids throwing the baby out with the bathwater and preserves the PCS as a valuable tool for providing efficient and effective water quality standards across the whole Ohio River.

B. Water Quality Assessment for the Ohio River

Sections 305(b) and 303(d) of the federal Clean Water Act require each state to conduct an assessment of the status of its waters every two years and make a determination as to whether those waters are “impaired” by any pollutant. 33 U.S.C. § 1315(b); 33 U.S.C. § 1313(d); 40 C.F.R. §§ 130.7, 130.8. ORSANCO has prepared a biennial section 305(b) assessment for the Ohio River ever since 2002, offering an expert view “of the degree to which the river supports each of its four designated uses: warm water aquatic life; public water supply; contact recreation; and fish consumption.” Although ORSANCO’s section 305(b) report does not substitute for each state’s duty to assess and determine the impairment status of the portions of the Ohio River within its jurisdiction, the Ohio River states have traditionally relied heavily on ORSANCO’s work in carrying out these Clean Water Act obligations. Often, states simply adopt ORSANCO’s evaluation and conclusions wholesale in determining the impairment status of the Ohio River.

If ORSANCO adopts Alternative 2, this approach will no longer be viable. Currently, ORSANCO’s water quality assessment in its section 305(b) reports is based in large part on application of the numeric criteria included in the Pollution Control Standards. If these criteria are eliminated, ORSANCO will either have to confront the problem of applying potentially hundreds of inconsistent state criteria in assessing the Ohio River’s water quality, and may end up reaching inconsistent conclusions as to impairment status of the river based on those criteria. Alternatively, it may no longer make sense for ORSANCO to conduct the 305(b) assessment for the Ohio River, merely shifting that work to individual states and probably losing efficiencies along the way. That scenario could also result in a reduction in ORSANCO’s funding.

Finally, we note that while these concerns represent our view of the existing information, we requested that ORSANCO share the “Report of the ORSANCO Ad Hoc Water Quality Standards Implementation Committee”, dated May 11, 2015, referenced in some of the materials provided for comment. ORSANCO provided a copy of that report on February 23, the day before the comment deadline. Although we have not had adequate time to review the report for purposes of these comments, we look forward to providing ORSANCO with supplemental comments as appropriate.

III. CONCLUSION

A proposal for ORSANCO to step back from standards it has set in their current form for more than two decades is obviously a significant one. Before the Commission determines the wisest course of action, it must conduct further analysis of the key assumptions here: that the Pollution Control Standards provide no additional water quality protection beyond state standards under the Clean Water Act, and that reducing or eliminating the Pollution Control Standards review process would free up resources without any burden-shifting to states or impacts to funding. While those assumptions may prove true to some extent, we believe the appropriate response is to narrow the focus of ORSANCO’s Pollution Control Standards process along the lines of Alternatives 3 and 4. That approach would keep ORSANCO in the role of doing what it does best: providing significant scientific expertise and a basin-wide perspective on protecting the Ohio River.

RE: PCS Comments

To Whom it may concern:

As I have read articles concerning the possibility of removing the ORSANCO pollution control standards from the OHIO river, I am appalled that such a motion has been made. Having grown up in Tell City, IN on the river I have very fond memories of a river that existed before any industry built across the river from us. I watched as a young adult how pollution began to take over the river and then as I got up in years, I was glad there were steps being taken to clean up the river. Now I find out, as what is happening throughout the country, we are moving backwards instead of forward.

Eliminating the PCS would be detrimental to the population who use the OHIO for recreation, drinking water, and a food source. We need these standards in place to keep an eye out for any accidental or intentional spills that effect not only the human equation, but the wildlife that depends on this river.

The OHIO River is not owned by industry. Please put the health of the citizen's ahead of the greed of industry. Turning the OHIO over to industry by removing these standards will surely have an adverse effect on health and the environment. Letting each state use their own standards on a body of water that stretches past several states is ludicrous. Not all states have the best standards for their citizenry. Some care more about their population than others. It is the ones who cater to industry that will surely ruin it for all of us, especially those of us down river that will have to deal with the total affects of each state's standards.

You can do the right thing. Please do! People first.

Sincerely,

Mary V Hess, President
Southwestern Indiana Citizen's for Quality of Life
Dale, IN 47523

Subject: Pollution Control Standards for discharges into the Ohio River
Date: August 20, 2018

I am writing to encourage ORSANCO to maintain it's standards for discharges into the Ohio River. With as many states that border the Ohio River, it is essential that there are systemic approaches to monitor and provide standards for all business and governments. If each state sets their own standards it will be a race to the bottom. The river needs your leadership.

River City Paddle Sports is a not for profit organization in Louisville's Waterfront Park at our environmental education center – 1325 River Road. We promote paddle sports on the Ohio. Currently, we are starting to work with the National Park Service and the U.S. Army Corps of Engineers on developing a national Watertrail from Cincinnati to Louisville. Annually we bring over 4,000 people on recreational programs on the Ohio River. Clean water is essential for our programs.

I hope that ORSANCO will continue to be a proponent of strict and enforceable standards.
Help clean up our Ohio River.

Re: Comments

Hello Orsanco Board,

Although, in the past, we have asked Orsanco to meet its mission, Floyds Fork Environmental Association (FFEFA) continues to come forward to once again request that Orsanco meets its mission. Here, we ask that you:

1. NOT abandon your responsibilities and
2. NOT give authority back to states – especially, Kentucky.

Many millions of people depend on the Ohio River for many purposes, including drinking water.

It is better to have Orsanco coordination and overview as well as be that body that can foster a comparative look at all states bordering the Ohio River.

We are all contributing to the DEAD ZONE further downstream.

As more attention is being paid to algal blooms and toxins that can be produced, human health is at risk.

Changes and leadership in Kentucky, we fear, are not in the best interests of all Kentuckians but rather the few. In these respects, we have concerns for the Ohio and inland waterways as well as those streams whose water flows on to the Ohio.

Floyds Fork Environmental Association is opposed to water pollution trading. This does not protect aquatic life forms that are in the vicinity or swimming along in the area of the more concentrated discharges. Please abandon “water pollution trading”. We know Kentucky Division of Water Director Peter Goodmann pushed for this back in 2007. Again, FFEFA opposes “water pollution trading”. We never want to see this occur in Floyds Fork Creek which flows thru 5 counties (6 counties if including tributaries) on to the Salt River and into the Ohio River.

Please do not allow Kentucky to make decisions on pollutant limits. We clearly

believe this would result in reducing the health of the mighty Ohio since more pollutant amounts would surely be discharged – to worsen water quality throughout the Commonwealth of KY and also contribute more to the DEAD ZONE.

FFEA looks to Orsanco to set consistent pollutant limits for all states bordering the Ohio River.

It is wrong to abandon your mission to protect the Ohio River. Consistent limits for all states would definitely have an impact and if problems, it would be easier to rectify pollution problems.

An example: once there was no limit or regulation of Phosphorus. In 2018, we are finding phosphorus in cereals, etc. This loading of Phosphorus might be found as a problem where the source could be changed with companies removing the pollutant from the food.

However, this needs to have the oversight of one body like Orsanco to have all the states bordering the Ohio recognize the problems and look for answers which all states could follow instead of being will-nilly.

No, FFEA does not always agree with Orsanco. Nevertheless, we ask Orsanco to not abandon responsibility along the Ohio River. Please do not relinquish control to KY Division of Water which needs oversight. Please do not do away with testing for numerous pollutants that can affect the public's health and food for the public.

Sincerely,

Teena Halbig
Planning Chair
Floyds Fork Environmental Association – since 1991

Attn: PCS Comments

Re: Comments on ORSANCO's Pollution Control Standards (PCS) Revisions

To Whom It May Concern:

Koppers Inc. appreciates this opportunity to comment on the revisions to the ORSANCO Pollution Control Standards – 2015 Revision (the PCS) proposed by the ORSANCO Commission. ORSANCO has played an important historical role in helping to protect and preserve water quality in the Ohio River and in providing water quality data and information to the States and the public. However, in light of the dramatic changes in water quality regulation that have occurred over the past 50-plus years, it is appropriate to step back and evaluate how ORSANCO can best fulfill its mission to protect water quality in the Ohio River in the years to come.

Koppers Inc. believes that the proposed PCS revisions satisfy the goals of the ORSANCO Compact and will ensure the continued protection of water quality and aquatic life in the Ohio River, while avoiding the imposition of unnecessary and duplicative regulatory burdens. ORSANCO was created in 1948, at a time when the absence of an effective regulatory framework resulted in a critical need for water quality improvements in the Ohio River. Since that time, a comprehensive system of federal and state water quality programs and standards under the aegis of the Clean Water Act has been developed and implemented in all the ORSANCO Compact States. The result has been a dramatic improvement in the quality of the Ohio River, its tributaries, and other streams throughout the Compact States.

Today, each of the Compact States is implementing a federally-enforceable water quality program approved by the U.S. Environmental Protection Agency (USEPA)

pursuant to the Clean Water Act. Each of those programs includes designated uses, “free from” mandates, water quality standards, wastewater discharge requirements, mixing zone provisions, and enforcement authorities. Those requirements are reviewed and approved by USEPA to ensure that they meet the requirements of the Clean Water Act and to provide consistency and predictability across the States’ programs. The result is a comprehensive regime that addresses each State’s streams as aquatic habitats and supports their uses for recreation and drinking water.

The ORSANCO PCS played a meaningful role in protecting water quality when the Compact was first signed, but they have become duplicative with the subsequent enactment of the federal Clean Water Act and related state water quality programs. Today, the water quality goals of the Compact are being effectively addressed by the Clean Water Act, and the PCS provide little, if any, additional environmental benefit to the Ohio River. In fact, the differences between the PCS and Clean Water Act standards can lead to confusion for the States and the regulated community, and can create complications in the permitting process, where there is often no effective way to question or challenge the appropriateness or applicability of the underlying PCS in specific permitting situations.

ORSANCO can provide the most value in the current regulatory environment and best meet the goals of the ORSANCO Compact by concentrating on its scientific and technical information gathering and research. This role allow will ORSANCO to continue to assist the States in carrying out their obligations under the Clean Water Act and to coordinate and promote consistency in water quality regulation throughout the Ohio River basin. This is an important role that only ORSANCO can perform under the current framework.

Specific Comments

In further support of this conclusion, Koppers Inc. notes the following:

- The PCS are largely duplicative of the States’ water quality standards adopted pursuant to the Clean Water Act. Beneficial use designations are essentially the same. Most water quality criteria are either the same or provide the same degree of human health and aquatic life protection. Mixing zone designations are similar. Given federal and State technology-based discharge requirements and water quality-based limits, the PCS wastewater discharge requirements are superfluous for most categorical industrial dischargers and municipal dischargers.

- Where there are differences between the ORSANCO PCS and state water quality criteria and implementation procedures, the PCS – which must be implemented by the States – sometimes result in NPDES permit conditions that are more stringent than otherwise required by the States’ standards – with no demonstrable environmental benefit.

- The implementation of the ORSANCO PCS creates confusion for the States and regulated entities. Unlike state water quality standards development and implementation, the process for adoption of the PCS provides no opportunity to challenge the appropriateness or applicability of the PCS. The result is that if a regulated entity believes that a particular PCS requirement is inappropriate, its only option is to challenge that requirement as applied in the entity’s NPDES permit – a process that does not allow the permittee to challenge the underlying soundness of the PCS and deprives permittees of regulatory and legal due process. Moreover, implementation of the PCS creates a separate set of standards that apply only to the Ohio River, and that differ from the standards that apply throughout the remainder of each of the Compact States. Eliminating this confusion will improve regulatory consistency and promote clarity for the regulated community.

- Today the regulated community faces a continual increase in the amount and complexity of environmental laws and regulations, with finite company resources available to stay abreast of the latest developments and ensure compliance. The ORSANCO PCS add another layer of complexity and cost on top of the already expansive federal and state regulatory scheme governing water quality – without demonstrable environmental benefit.

- The proposed PCS revisions would relieve ORSANCO of the significant burden of periodically reviewing and updating water quality criteria for the many pollutants currently regulated under the PCS. Under the Clean Water Act, USEPA carries this burden by periodically developing and updating recommended water quality criteria based on the latest science. The ORSANCO Compact States use the USEPA-recommended criteria to fashion their respective State water quality standards. Because the State water quality standards must protect designated uses of the Ohio River and must be approved by USEPA, the public can be assured that the goals of the ORSANCO Compact and the Clean Water Act are being addressed in a comprehensive manner.

- The resources ORSANCO currently devotes to the PCS program can be more effectively used to support other ORSANCO programs that do not overlap with state and federal water quality programs, and that provide real added value to the States.

ORSANCO has particular skill and expertise in assessing water quality and the biological integrity of the Ohio River, disseminating that information to the States and public to ensure coordination and consistency among the States' regulatory programs and other water quality initiatives, engaging in public outreach, and assisting in spill detection and response through information-gathering and coordination. These functions can provide meaningful and long-lasting benefits to water quality throughout the Ohio River basin by providing support to the States in satisfying their Clean Water Act obligations without unnecessarily wasting regulatory resources and creating confusion for the regulated community.

- Most importantly, the beneficial uses of the Ohio River associated with nearly all PCS water quality criteria are being achieved throughout the River, with a small number of exceptions that are being addressed through the States' Clean Water Act programs, under the oversight of USEPA.

In sum, Koppers Inc. believes that the proposed revisions to the ORSANCO PCS will help maintain the beneficial uses of the Ohio River consistent with the mandates of the ORSANCO Compact, while removing the duplicative and resource intensive aspects of the PCS. And they will allow ORSANCO to concentrate its resources on those tasks that it can best perform to help promote and preserve water quality in the Ohio River. We look forward to the Commission's formal approval of this proposal at its October 2018 meeting.

Thank you again for the opportunity to comment on the proposed revisions to the ORSANCO PCS and for your careful attention to these comments.

Sincerely,
Mark C. Alan

ATTN: PCS Comments

To Whom It May Concern:

I am writing on behalf of the City of Evansville expressing opposition to the proposal of eliminating pollution control standards for the Ohio River. Frankly, ORSANCO has provided invaluable support to the Evansville Water and Sewer Utility relating to water quality for several decades. The citizens of Evansville are grateful for that support.

ORSANCO has the unique role of ensuring that all states (and polluters) in the Ohio River watershed are held to the same standards. It seems that the elimination of water quality criteria developed for the Ohio River by ORSANCO could well be detrimental to the river, and the watershed as a whole.

I understand that one of the reasons cited for the consideration of discontinuing the triennial review process of updating the PCS rules is to eliminate redundancies that overlap with federal and state regulations. I find it interesting, however, that there are more than 180 instances where ORSANCO's rules are not redundant to state and federal regulations.

As mayor, there is nothing more frustrating than dealing with conflicting or duplicative federal regulation. However, we believe that the standards in place do not constitute an unnecessary regulatory burden, and rather provide certainty for regulated entities along the length of the Ohio River, while also providing protection of designated uses.

In addition to providing drinking water to 5 million people, the Ohio River is known as a "working river" because of the hundreds of industrial and wastewater treatment plants along its 981-mile route. Evansville is located at Ohio River mile marker 791, well downstream from the river's origin. Therefore, upstream water quality is very important to our city. The Ohio River is an amazing asset for Evansville. It serves as our water source, but also as a vital recreational venue and picturesque front door. Eliminating ORSANCO regulations could be a negative game changer for our community.

The City of Evansville recommends and encourages ORSANCO to continue to oversee Ohio River Pollution Control Standards to ensure the highest water quality possible.

Thank you for your thoughtful consideration.

Sincerely,

A handwritten signature in black ink, appearing to read "Lloyd Winnecke". The signature is fluid and cursive, with a large initial "L" and "W".

Lloyd Winnecke, Mayor
City of Evansville

Cincinnati, OH 45230

Attn: PCS Comments

Dear Commissioners,

Communities United For Action implores you to keep your pollution control standards.

The Ohio River has repeatedly been ranked as one of the most polluted rivers in our country. Five million people depend on it for drinking water and millions more for recreation.

For too long, we have allowed polluters to help determine policies that are supposed to protect this most precious freshwater resource. With the current pollution control standards, we know that the river is unsafe for swimming and that Cincinnati has spent an untold amount of ratepayer money closing its drinking water intakes during pollution events and on additional technology to make Ohio River water safe to drink.

Caving to this industry wish list will make our river worse, and it's absurd that a body charged with protecting our river would even consider such a proposal. When they pollute, we pay.

ORSANCO, in its role as the long-time regulatory authority over Ohio River pollution, must instead bolster regulation with a singular focus on improving the health and safety of the Ohio River, not serving the interests of polluters along it. We know that if we don't use our regulatory authority over polluters, they will pollute more. We also know that we cannot live without safe, clean water.

We implore you to:

- Reject the proposal to gut your pollution control standards;
- Immediately increase pollution control standards for discharges of untreated sewage and mercury; and
- Use the next triennial review period to consider what more ORSANCO can do to improve Ohio River water quality.

Below, you will find individuals whom have signed onto the above comments and provided additional comments opposing the proposal to end ORSANCO's role as a regulatory authority.

Sincerely,
Communities United For Action

As a mother of six and grandmother of 12, who all depend on the Ohio River for their drinking water, I implore you NOT to gut the control standards for the Ohio River. This river valley is known for its higher cancer rates. The air and water must be protected for current and future generations. The interests of big business shouldn't be put above the health and safety of our children and future generations !

Keep the pollution control standards!!!Polluting one of the most valuable natural resources to millions of people in Ohio and surrounding areas is irresponsible and should not be allowed. Rivers has given humans life , growth and prosperity.We should protect rivers the same as we would protect our own families. Rivers are pivotal to keeping healthy ecosystems and health generations to come.

Subject: Eliminating Pollution Standards for the Ohio River by ORSANCO
Date: Monday, August 20, 2018 10:18:36 PM

I just learned of the proposal to lower pollution standards for the Ohio River by ORSANCO to the pollution level of some of the states connected to the river. I think that this is a bad idea, and I urge you to vote no on this decision. Individual states may have lower standards because they are upstream, where pollutants are not as large a problem. Other factors, like industrial influence should not be a reason to lower standards. As the director of a biological field station with a natural area wetlands on the Ohio River, I am deeply concerned about additional pollution that will impact this natural resource. This ecosystem is the largest wetland habitat in Northern Kentucky that borders the Ohio River, and its ecosystem services could be irreparably damaged with increase river pollutants. I would recommend that ORSANCO continue to educate the public on the need for clean water and work to persuade high polluting states to elevate their standards to maintain a healthy river way.

Subject: PCS public comment submission from Ohio River Fdn
Date: Monday, August 20, 2018 10:26:07 PM

To Whom It May Concern:

The Ohio River Foundation (“ORF”) submits these comments to the Ohio River Valley Water Sanitation Commission (“ORSANCO”) regarding the 2018 review of ORSANCO’s Pollution Control Standards (“PCS”). In its solicitation of comments, ORSANCO indicated that a majority of Commissioners support withdrawing from its role in maintaining, administering, and periodically updating the current Pollution Control Standards. ORF strongly opposes that proposal and urges ORSANCO to continue in its role as a source of consistent and expert input on appropriate pollution control standards for the Ohio River. Therefore, we ask the Commission to reject proposed Alternative 2.

We attach below the initial ORF comments submitted on February 20, 2018, for reference, rather than reiterating the same points here.

These supplemental comments focus on providing new information we have developed since the initial review period. A central assumption of ORSANCO’s initial discussion of this proposal was that the ORSANCO PCS are redundant and unnecessary in light of state regulation under the Clean Water Act

Comment

Stretching nearly 1,000 miles as it winds its way through six states, the Ohio River provides drinking water to 5 million people.

For decades, the Ohio River Valley Water Sanitation Commission (ORSANCO) has issued water quality standards for the river, but now ORSANCO wants to abandon that practice. The ramifications of such a monumental policy decision cannot be understated. Our river is cleaner overall than it was 70 years ago. However, the last 15-20 years have seen minimal improvement; the river still receives millions of pounds of toxic pollutants every year.

ORSANCO’s stated purpose is to control pollution of the Ohio River. That’s a vital role: the Clean Water Act and other federal water laws don’t do a good job of regulating multi-state waters, like the Ohio River. The states along the river (Ohio, Indiana, Kentucky, West Virginia, Illinois and Pennsylvania) either develop their own water quality standards or adopt ORSANCO standards. There is disparity as to how different states arrive at their standards, and the permits they issue businesses to pollute the river reflect that difference. Furthermore, for more than 100 pollutants, ORSANCO issues standards where no state guidelines exist. In keeping with its bylaws and mission, ORSANCO should be the driving force for uniformity in pollution control for this multi-state river. If different conditions exist along the 981-mile river, then ORSCANCO should work with the states to develop standards that are appropriate and fair and do not abridge downriver states’ rights or conditions.

At recent meetings, ORSANCO revealed that standards work reflects only about 10 percent of its budget. So, any claim that this work is a financial drain on the organization is a red herring. While the agency’s monitoring and sampling work is important, those activities are reactive to river pollution. The standards work is proactive, preventative and necessary to help keep pollution out of the river, making it safer and more reliable as a water source for 5 million people and thousands of businesses.

In some cases, ORSANCO’s standards may be different than state standards. This should motivate ORSANCO and the states to reconcile differences. Instead, some states are exerting enormous pressure on

ORSANCO to relinquish its standards setting role with the expectation that all the states will agree to appropriate standards protective of each state's water quality. This is a risky bet where interstate cooperation is susceptible to state political interests. Setting standards is hard work on behalf of the public interest that should be embraced and vigorously pursued. ORSANCO should not take the easy way out and just walk away.

Abdicating its role and responsibility is an affront to millions of people who depend on the river as their sole source of drinking water. Citizens at a public hearing voiced their concerns and news outlets in Ohio, Kentucky, Indiana, West Virginia and Pennsylvania have published articles questioning the merit of this proposal. The public and some states have valid concerns, and ORSANCO should not turn a deaf ear or blind eye.

Rich Cogen, Executive Director
Ohio River Foundation

COMMENTS SUBMITTED ON FEBRUARY 20, 2018 by Ohio River Foundation

I. BACKGROUND

A. ORSANCO's History and Authority

The Ohio River flows almost a thousand miles through six states, with more states included in its drainage basin. In 1948, eight of those states – Illinois, Indiana, Kentucky, New York, Ohio, Pennsylvania, Virginia, and West Virginia – signed the interstate compact that created ORSANCO and established the commitment of those states to “enact any necessary legislation to enable each such State to place and maintain the waters of said basin in a satisfactory sanitary condition, available for safe and satisfactory use as public and industrial water supplies after reasonable treatment, suitable for recreational usage, capable of maintaining fish and other aquatic life, free from unsightly or malodorous nuisances due to floating solids or sludge deposits, and adaptable to such other uses as may be legitimate.” The Compact provides ORSANCO with authority to promulgate rules and issue orders to ensure that “[a]ll industrial wastes discharged or permitted to flow into the aforesaid waters shall be modified or treated, within a time reasonable for the construction of the necessary works, in order to protect the public health or to preserve the waters for [these uses] . . . to such degree as may be determined to be necessary by the Commission after investigation, due notice and hearing.”

As early as 1949, ORSANCO began putting in place water treatment standards to carry out this obligation. In 1972, Congress enacted the “Clean Water Act” (“CWA”) as we know it today, and in 1984 ORSANCO revised its standards to mirror the Clean Water Act structure of designated uses, water quality criteria to protect those uses, and effluent limitations (including mixing zone requirements and a variance procedure). ORSANCO has since reviewed and updated these Pollution Control Standards every three years.

B. The 2018 Pollution Control Standards Proposal

In 2014, ORSANCO established the Ad Hoc Committee on Water Quality Standards Implementation to review how the Pollution Control Standards were being implemented. In 2015 ORSANCO directed the committee to evaluate options relating to ORSANCO's future role in setting water quality standards. The committee subsequently formulated five alternative proposals for ORSANCO's role going forward. These alternatives can be grouped into two categories, with Alternatives 1, 2 and 5 calling for a markedly

reduced role and Alternatives 3 and 4 calling for a more focused application of ORSANCO's current standard-setting approach. These five alternatives, and the relevant considerations for each, are described in ORSANCO's Water Quality Standards Alternative Summary.

Alternative 1 would "[e]liminate the Pollution Control Standards Program and defer to the requirements of the Clean Water Act and member state water quality regulations." The considerations listed in favor of this alternative are that it would potentially "free up resources" to be reprogrammed to other ORSANCO activities, and would also avert the problem that at least one Ohio River state cannot adopt ORSANCO's Pollution Control Standards by reference.

Alternative 2 would suspend the triennial review process for the Pollution Control Standards and deem all states in compliance with the Standards to the extent they are implementing approved programs under the federal Clean Water Act. The description of this alternative presumes that the Pollution Control Standards are redundant and that resources currently dedicated to the PCS could be "redirected to other Commission activities" such as "assessments of the water quality and biological integrity of the water, public out-reach, spill detection and response."

Alternative 3 would "[u]tilize a cost effective approach to finalize uniform WQS rules for the Ohio River by tasking ORSANCO to take the lead in order to eliminate duplication of efforts among six states and save resources. Also, as a starting point, utilize work done by USEPA to develop WQS to avoid conducting basic research." This proposal would be aimed at protecting water quality and promoting consistency among states, while reducing the overall costs of developing water quality standards and allowing states flexibility to adopt alternative standards when appropriate. It would also enable ORSANCO to continue carrying out the work plan requirements for its section 106 grant from U.S. EPA, which currently includes development of numeric pollution control standards for the Ohio River and constitutes 50% of ORSANCO's budget.

Alternative 4, similar to Alternative 3, would focus on harmonizing water quality standards across the Ohio River. ORSANCO would look at "standards on an individual basis as warranted," to ensure coordinated implementation to "restore and maintain the quality of and protect uses of the Ohio River." This approach would be carried out by the NPDES Committee, working with staff and member states on permitting and certification processes "with a goal of assuring that protection and achievement of pollution controls needed to maintain those uses occurs throughout the Ohio River system." Even where a state has not formally adopted an ORSANCO standard, the Commission will work with the state so that any permit "achieves a comparable level of protection of the designated uses."

Finally, Alternative 5 would alter the nature of the PCS, from binding standards to simple recommendations that member states should consider in developing and issuing permits. This alternative rests on the proposition that "the process of promulgating the PCS is redundant of member states' triennial review of water quality standards."

ORSANCO has identified Alternative 2 as its "preferred alternative" for consideration in the 2018 PCS review.

II. DISCUSSION

The Commission's preference for Alternative 2 appears to rest primarily on two grounds: first, that it will save resources for ORSANCO to eliminate the Pollution Control Standards from its workload; and second, that the Pollution Control Standards do not serve a significant function in protecting the Ohio River.

Neither of these rationales has been adequately explored or supported with detailed facts.

It is entirely reasonable for ORSANCO to be concerned about making the most of its limited financial resources. However, in considering the best use of those resources, it is important to keep in mind that the ORSANCO Pollution Control Standards play an important role in preserving state resources by allowing standards for at least some pollutants, as well as the overall assessment of whether the Ohio River is suffering any serious water quality problems, to be dealt with across the entire river rather than on a state-by-state basis. If ORSANCO were to eliminate the PCS, Ohio River states might well be worse off in the long run without an efficient forum for establishing and updating standards for all pollutants, and an irreplaceable venue for determining a river-wide approach to particularly problematic pollutants.

A. Individual Pollutants

ORSANCO has provided summary-level data from a 2015 staff survey (“SURVEY”) of state water quality standards versus ORSANCO’s Pollution Control Standards, which shows that there are significant discrepancies among state standards. While Alternative 2 presumes that these discrepancies are meaningless and that the PCS and state water quality standards are redundant, that presumption is not backed up by any factual analysis nor clear from a review of the SURVEY. Moreover, Alternative 2 also assumes that if the PCS were eliminated, ORSANCO could redirect the resources used to maintain the PCS with no adverse effects on ORSANCO or its member states. That reasoning likewise lacks any detailed foundation.

1. The Problem of State-ORSANCO Disparities

The ORSANCO SURVEY indicates that, for the pollutants compared as of 2015:

- There are 188 instances in which ORSANCO has criteria but a member state environmental agency does not;
- There are 252 instances in which member state agencies have parameters that are more than 10% less stringent than ORSANCO’s criteria;
- There are 405 instances in which the member state agencies are within 10% of, or more stringent than, the ORSANCO criteria.
- There are 342 instances in which the member state has criteria but ORSANCO does not.

In other words, based on this SURVEY there are 440 pollutants for which the ORSANCO standard is either more stringent than a member state standard or there simply is no state standard. By comparison, there are 747 instances where the state standard is more stringent than or equivalent to the ORSANCO standard, or ORSANCO lacks a standard for the relevant pollutant. Overall, this represents 1187 points of comparison, with 440 – or almost 40% -- where the ORSANCO standard is filling in a gap in state standards or providing a more protective standard.

ORSANCO provided tables containing the information underlying this comparison on February 20, 2018, four days before the deadline for comment, and therefore we have not undertaken a thorough analysis of individual water quality criteria. However, even an initial survey of the data shows that there are concerning inconsistencies and gaps among the state standards. For example, the human health criteria table shows that as of 2015, Ohio and Kentucky both had limits of 10 micrograms per liter for arsenic – significantly higher than ORSANCO’s 0.1 microgram per liter criterion. Similarly, Indiana and Ohio both apparently have criteria for polychlorinated biphenyls (“PCBs”) that are less stringent than ORSANCO’s,

which is particularly notable given that the Ohio River's fish consumption use is partially impaired by PCB contamination. While the explanation for these discrepancies is unknown, it shows that some states' standards are not as protective as those in other Ohio River states. Without an ORSANCO standard providing uniformity, there is potential for polluting industries to migrate to states with less restrictive criteria, leaving those states downstream or across the river to deal with their pollution without gaining any of the economic benefits.

The Clean Water Act does not provide an efficient tool for states to address such discrepancies on their own. The Supreme Court confirmed in *Arkansas v. Oklahoma*, 503 U.S. 91 (1992), that the U.S. Environmental Protection Agency ("U.S. EPA") has the authority to consider effects on other states water quality standards when reviewing draft permits under Clean Water Act section 402, 33 U.S.C. § 1342. However, that authority must be applied on a permit-by-permit basis, and is discretionary with U.S. EPA, meaning that policing of interstate discharges through this mechanism would be an onerous and potentially sporadic process without any certain outcome. ORSANCO's authority to set prospective, uniform standards for the Ohio River is a unique tool not available under the Clean Water Act. Even to the extent states do not directly incorporate the ORSANCO PCS into their water quality criteria, but rather apply them to individual sources through the state permitting process, that is still an improvement over the cumbersome and likely ineffective process available under the CWA

In addition to inconsistent standards, there are some standards where – at least according to the ORSANCO SURVEY – the states have simply left it to ORSANCO to establish criteria. These include gross total alpha, copper, cyanide, fluoride, methylmercury, nitrites, and others. If ORSANCO were to eliminate its Pollution Control Standards, states without standards for those pollutants would presumably have to expend time and resources on filling in those gaps to ensure protection of their portions of the Ohio River.

Overall, this cursory review suggests that the ORSANCO standards play a central role in ensuring consistent and up-to-date pollution standards for the Ohio River. Meanwhile, the current proposal provides no estimate, or even description, of what state work would be necessary to make up for the absence of the PCS if they were eliminated. Comments from the POTW Advisory Committee (provided by ORSANCO) underline this concern, with one commenter pointing out that: "During this time of 'stressed' budgets and limited resources, duplication of efforts is definitely a major concern of many organizations at all levels of government (federal, state and local), as well as the public (tax/rate payers) that we serve. Under any future scenario that minimizes PCS activities, it will be important for ORSANCO to continue to provide a forum to discuss water quality standards and to promote consistency among the states to ensure the protection of the Ohio River as a shared resource." A significant problem with Alternative 2, or any approach that eliminates periodic consideration of river-wide water quality criteria, is the danger that in the absence of ORSANCO standards, inconsistencies will arise between states.

2. The Value of River-Wide Water Quality Criteria

As discussed above, there are clearly significant inconsistencies among state standards for the Ohio River that bear further investigation before ORSANCO can draw any conclusions about the potential costs for states to make up for the loss of the PCS. Meanwhile, the affirmative value of river-wide criteria is clear. There have already been a number of instances where ORSANCO's Pollution Control Standards have and will continue to play an important role in protecting water quality in the Ohio River.

For example, over the last decade ORSANCO has acted to address a growing concern with levels of Total Dissolved Solids ("TDS") in the Ohio River, by using an expedited PCS process in 2012 to reinstate a

(previously eliminated) limit of 500 mg/L at drinking water intakes in order to protect drinking water quality. ORSANCO staff have subsequently conducted valuable research regarding background levels of TDS in order to support translation of that standard into appropriate permit limits. See ORSANCO, *Characterization of Dissolved Solids in the Ohio River and Selected Tributaries* (Feb. 2014), available at <http://www.orsanco.org/wp-content/uploads/2016/12/Characterization-of-Dissolved-Solids-in-the-Ohio-River-and-Selected-Tribuatries.pdf>. This is an instance where ORSANCO, because of its triennial PCS review process, was well-positioned to react swiftly to a unique Ohio River problem and provide drinking water protection along the entire river, backed up by sound science and expertise. Without the PCS process, it is not clear when affected states – themselves facing budget constraints – might have dealt with this problem and what resources they might have to use to do so. The Water Users Advisory Committee comments similarly identify pollutants such as ammonia, E. coli, temperature, and others as ones where ORSANCO’s standards provide important, uniform water quality protection across the entire Ohio River to the benefit of states as well as their citizens.

Even where addressing a given pollutant is simply a matter of adopting water quality criteria issued by U.S. EPA, ORSANCO can do so efficiently in order to bring the PCS up-to-date for the entire Ohio River at one time. As one example, ORSANCO has repeatedly indicated its readiness to adopt an updated U.S. EPA aquatic life criterion for selenium. Now that the federal criteria have been issued (in summer 2016), ORSANCO can do so. Notably, some states will not be conducting triennial reviews in which they would address this development for some time – for instance, West Virginia adopted fish tissue limits based on the draft criteria in 2016, but apparently will not address the water column limits in the final criterion until its next triennial review in 2020. By addressing this issue in its 2018 PCS review, ORSANCO will ensure those additional protections are in place significantly earlier. Moreover, in addressing this and other federal criteria, ORSANCO can determine on a river-wide basis whether those criteria are appropriate for the Ohio River rather than leaving individual member states to do so, with potentially disparate results.

Looking ahead, there are emerging pollution issues where ORSANCO’s PCS may similarly provide an important avenue to bring the expertise of Commission staff to bear on preserving water quality across the entire Ohio River. In recent years, ORSANCO has been engaged in trying to determine a numeric criterion for nutrient pollution in the Ohio River. This work is timely given that a massive algal bloom occurred on the river in the summer of 2015, and studies show climate change is driving temperature and precipitation changes that may increase the frequency and severity of such algae outbreaks. U.S. Army Corps of Engineers, *OHIO RIVER BASIN– Formulating Climate Change Mitigation/Adaptation Strategies through Regional Collaboration with the ORB Alliance 47* (May 2017), available at http://www.corpsclimate.us/docs/USACE%20Ohio%20River%20Basin%20CC%20Report_MAY%202017.pdf. Although ORSANCO’s analysis has not yet identified an appropriate numeric criterion, this is a looming threat to the drinking water, recreation, and aquatic life uses of the Ohio River that ORSANCO cannot ignore. Moreover, as shown in ORSANCO’s efforts to date, the Commission’s staff has the relevant expertise to adequately and efficiently address this complex issue on a river-wide basis. The alternative might well be for states to waste resources as the question of numeric nutrient limits comes up on a state-by-state or even permit-by-permit basis.

Finally, ORSANCO is currently considering a study of the bioaccumulative pollutants Perfluorooctanoic Acid (“PFOA”) and Perfluorooctane Sulfonate (“PFOS”), initially identified as of potential concern in a 2010 report on emerging contaminants (<http://www.orsanco.org/wp-content/uploads/2017/01/A-Screening-Study-Investigating-the-Presence-of-Emerging-Contaminants-within-the-Ohio-River-Basin.pdf>). Recently, as noted in ORSANCO’s October 2017 TEC meeting minutes, PFOA contamination of drinking water in the Ohio River watershed has been the subject of significant litigation, and U.S. EPA has released health

advisory levels for both contaminants. Although PFOA and PFOS are being largely phased out, replacement chemicals with similar properties may continue to pose a threat to Ohio River water quality. Once ORSANCO determines the scope and seriousness of this issue, it may well be appropriate to address this type of pollution through the PCS.

We could list many more instances of ORSANCO's valuable work in connection with the Pollution Control Standards. However, these examples are sufficient to highlight the key questions that Alternative 2 fails to address:

- Will eliminating the Pollution Control Standards actually significantly reduce ORSANCO's workload? A number of the efforts above, although occurring in conjunction with ORSANCO's PCS reviews, fall within its larger mission of providing expert scientific monitoring and analysis of water quality issues in the Ohio River. If the PCS were not in place, it seems likely that ORSANCO would still have a role to play in addressing issues such as identification of numeric nutrient criteria or analysis of total dissolved solid levels. Absent a detailed consideration of what work ORSANCO could in fact abandon if the PCS were eliminated, the answer to this question is unclear.
- If eliminating the PCS does truly reduce ORSANCO's activities, will it simply shift work to ORSANCO member states? For pollutants like Total Dissolved Solids, there is a clear need for a limit and analysis of how to apply that limit to sources. ORSANCO is currently providing that information in the context of the PCS. Eliminating that standard, or precluding ORSANCO from adopting such standards in the future, may simply force each state to individually duplicate the Commission's work while introducing the possibility of more disparities among water quality criteria the Ohio River states. As several other commenters have noted, this shift in workload may also result in a commensurate reduction in federal or other funding.
- Will adopting Alternative 2 prevent ORSANCO from addressing emerging pollution issues in a timely manner? Although the Commission could technically resume its role in setting standards, the regular triennial review process encourages all stakeholders to actively consider and address whether existing standards are adequately protecting the Ohio River's water quality. Without that forum for consideration of both urgent problems like TDS and developing issues like nutrient pollution, inadequate or disparate state-level regulation could easily go unaddressed.
- Are there opportunities to increase the efficiency of the PCS process without eliminating ORSANCO's standards altogether? As noted above, there are a number of pollutants for which the PCS and state standards are similar, as well as a number where there are significant differences. We are sensitive to ORSANCO's concerns regarding whether its PCS work is redundant to ongoing state activities under the Clean Water Act. One sensible way to potentially streamline the PCS reviews would be to focus on promoting uniform standards across the Ohio River, especially for pollutants where U.S. EPA has not provided any federal criteria. This would essentially be a combination of Alternatives 3 and 4.

These significant unanswered questions show that the preference for Alternative 2 is not based on a sufficient exploration of the important issues involved in potentially eliminating a role that ORSANCO has played for decades. Fundamentally, we believe that the current PCS process is in fact efficient and focused on the areas where ORSANCO is needed most. Nevertheless, if ORSANCO does decide to refine its approach to the PCS, we urge the Commission to ensure it avoids throwing the baby out with the

bathwater and preserves the PCS as a valuable tool for providing efficient and effective water quality standards across the whole Ohio River.

B. Water Quality Assessment for the Ohio River

Sections 305(b) and 303(d) of the federal Clean Water Act require each state to conduct an assessment of the status of its waters every two years and make a determination as to whether those waters are “impaired” by any pollutant. 33 U.S.C. § 1315(b); 33 U.S.C. § 1313(d); 40 C.F.R. §§ 130.7, 130.8. ORSANCO has prepared a biennial section 305(b) assessment for the Ohio River ever since 2002, offering an expert view “of the degree to which the river supports each of its four designated uses: warm water aquatic life; public water supply; contact recreation; and fish consumption.” Although ORSANCO’s section 305(b) report does not substitute for each state’s duty to assess and determine the impairment status of the portions of the Ohio River within its jurisdiction, the Ohio River states have traditionally relied heavily on ORSANCO’s work in carrying out these Clean Water Act obligations. Often, states simply adopt ORSANCO’s evaluation and conclusions wholesale in determining the impairment status of the Ohio River.

If ORSANCO adopts Alternative 2, this approach will no longer be viable. Currently, ORSANCO’s water quality assessment in its section 305(b) reports is based in large part on application of the numeric criteria included in the Pollution Control Standards. If these criteria are eliminated, ORSANCO will either have to confront the problem of applying potentially hundreds of inconsistent state criteria in assessing the Ohio River’s water quality, and may end up reaching inconsistent conclusions as to impairment status of the river based on those criteria. Alternatively, it may no longer make sense for ORSANCO to conduct the 305(b) assessment for the Ohio River, merely shifting that work to individual states and probably losing efficiencies along the way. That scenario could also result in a reduction in ORSANCO’s funding.

Finally, we note that while these concerns represent our view of the existing information, we requested that ORSANCO share the “Report of the ORSANCO Ad Hoc Water Quality Standards Implementation Committee”, dated May 11, 2015, referenced in some of the materials provided for comment. ORSANCO provided a copy of that report on February 23, the day before the comment deadline. Although we have not had adequate time to review the report for purposes of these comments, we look forward to providing ORSANCO with supplemental comments as appropriate.

III. CONCLUSION

A proposal for ORSANCO to step back from standards it has set in their current form for more than two decades is obviously a significant one. Before the Commission determines the wisest course of action, it must conduct further analysis of the key assumptions here: that the Pollution Control Standards provide no additional water quality protection or function beyond state standards under the Clean Water Act, and that reducing or eliminating the Pollution Control Standards review process would free up resources without any burden-shifting to states or impacts to funding. While those assumptions may prove true to some extent, we believe the appropriate response is to narrow the focus of ORSANCO’s Pollution Control Standards process along the lines of Alternatives 3 and 4. That approach would keep ORSANCO in the role of doing what it does best: providing significant scientific expertise and a basin-wide perspective on protecting the Ohio River.

In closing, as ORSANCO looks for ways to reallocate its budget we fear that it has developed a solution in search of a problem.

Re: Comments on PCS

I oppose and object to the proposed changes to the Pollution Control Standards (PCS) and ask that ORSANCO retain the language passed in 2015. ORSANCO's mission is "to ensure protection of these uses and to preserve the waters for other legitimate purposes" if it proceeds with the adoption of the changes proposed to the PCS it will be abdicating this responsibility.

For a number of states, permits will be less stringent if the Commission votes to approve these changes and abdicates its responsibility to protect the river. This will certainly not result in improved water quality in the Ohio River. It will likely not even result in the status quo for water quality.

US EPA addressed the very issue at the crux of ORSANCO's assumption in a study, titled *A Study of Prospective Water Pollution Control Activities For The Ohio River Valley Water Sanitation Commission*, was released in March 1975, and with respect to "stream standards," recommended that:

Since the Ohio is a boundary river, and because there are many other relationships as among the several state segments of the river system, the interstate agency should provide the overall view and the comparative analyses needed for coordination, consistency and equity.

Standards vary state by state. Currently, the PCS regulations require that state use ORSANCO standards or a state standard if it is more stringent. Therefore, the protections will not be consistent or as stringent if these changes are approved and the PCS regulations are gutted.

I object to the proposed changes. If approved ORSANCO is abandoning its mission and obligation to the people of the Ohio River Basin, but even worse, the water quality and quality of life of people in the Ohio River Basin will continue to suffer.

Lane Boldman

Subject: Pollution Control Standards for Discharges to the Ohio River, 2015 revision
Date: Tuesday, June 26, 2018 3:56:48 PM

I want to comment on discharge standards even if I have no time to study the proposed amendments. It is simply essential to adopt the highest standards possible when determining allowable degree of chemical pollution to waterways. There should be no pollutants. The cost should be born by companies creating the chemicals, who in turn may have to pass on some cost to consumers. We need clean water.

Sincerely,
Sally Gagné

Subject: AMERICANS DEPEND ON ORSANCO SETTING POLLUTION STANDARDS
Date: Wednesday, June 27, 2018 8:01:24 AM

Please keep setting pollution standards for the Ohio Rivers.

Millions of Americans drink from this Ohio.

Millions of Americans recreate on the Ohio.

ORSANCO has a responsibility to the people who live along the Ohio to protect us from pollution and the current plans to stop setting pollution regulations betrays millions of American citizens.

ORSANCO do your job, set pollution standards based on science that protect the public's health, the environment, and helps improve water quality in the Ohio River.

Sincerely

From: [Patrick](#)
To: PCS@orsanco.org
Subject: Clean water standards
Date: Tuesday, July 03, 2018 11:45:45 PM

To whom it may concern:

In recognition of the successes of the federal Clean Water Act and the related state water pollution control programs of member states, the Pollution Control Standards (PCS) should be revised by adding a provision that recognizes that water quality standards and criteria, as well as mixing zone requirements, and other provisions of the PCS are being adequately addressed by member states in accordance with programs appropriate for implementation of the federal Clean Water Act. To the extent that all member states are operating under such programs, the Commission may conclude that it need not continue the triennial review process related to the water quality criteria (and related provisions) of the PCS.

I strongly disagree that state-level pollution control standards are adequate.

Sincerely,

Patrick Pagano

Subject: Re: Proposed changes to the Pollution Control Standards for discharges into the Ohio River
Date: Thursday, July 05, 2018 3:15:58 PM

ORSANCO ORSANCO,

As a constituent, I'm writing to express my concerns regarding the proposed changes to the Pollution Control Standards for discharges into the Ohio River.

ORSANCO's proposal to eliminate pollution control standards and withdraw from the process of maintaining and updating the standards moving forward is not acceptable. This approach jeopardizes the ongoing clean up and restoration of the Ohio River and is counter to the original 1948 compact that outlined the importance of watershed-wide cooperation through a joint or common agency.

The Ohio River is at a critical juncture, again topping the list of most polluted rivers in the country. Eliminating these standards puts approximately 5 million Americans' drinking water and approximately 25 million people's quality of life and local economies at risk.

It is imperative for the Commission to uphold its responsibilities to ensure the protection and restoration of the Ohio River and the millions of Americans who depend on the river for drinking water, the numerous businesses, and approximately 25 million Americans quality of life. Everyday we wait to protect and restore the Ohio River the problems become more complex and the solutions more costly. I strongly encourage ORSANCO to uphold its responsibility and protect the Pollution Control Standards, rather than rolling back protections for one of the nation's most important resources.

Dear friends,

Several states rely on ORSANCO's standards and adopt them as their own to protect their own watersheds. If ORSANCO no longer sets these standards, those states will have to expend the financial resources to develop the requisite standards, or they may assume that standards are no longer needed at all.

Please continue trans-state protection.

in faith,

Subject: Comment on ORSANCO deliberation
Date: Thursday, July 12, 2018 3:34:34 PM

I strongly disagree with any effort to reduce the standards that ORSANCO has as part of its commission and work. I agree with thOSE commissioners of ORSANCO who have expressed “grave concern” with the move and argue that eliminating the body’s standards when it comes to ambient levels of various pollutants can only hinder efforts to maintain and improve the river’s health.

“ORSANCO, as a federally-sanctioned compact among several signatory states, possesses a degree of insulation from the vagaries of the political process, and is able to research, develop, propose and adopt standards tailored to the specific needs of the river in an atmosphere that stresses sound science and data-driven policy,” dissenting commissioners said in their minority report opposing the elimination of the rules.

[The minority cited](#) recent [moves by Congress and the Trump administration](#) that they say raise concerns about commitment to environmental protection. [The elimination](#) of the federal Stream Protection Rule and [proposals by the EPA](#) to revise guidelines for what counts as protected bodies of water, they say, “reflect that the standards and scope of the Clean Water Act and regulations adopted pursuant to that Act are neither static, nor necessarily as broad or protective, as might be needed to address the specific needs of the Ohio River Basin.” I agree with these commissioners.

There are roughly 600 permitted companies and other groups discharging into the Ohio River. The federal Clean Water Act, administered by the EPA, recommends maximum levels of pollutants these entities are allowed to discharge. States, however, make their own standards, which the EPA then approves.

ORSANCO’s standards exist alongside those state standards. While the state guidelines generally regulate what is coming specifically out of dischargers’ pipes, the commission creates guidelines for ambient pollution levels in the water as a whole.

While some commissioners supporting a rollback of ORSANCO’s pollution standards say that the state guidelines largely achieve goals for pollution reduction on their own, dissenting commissioners point out that there are 188 instances in which ORSANCO has set pollution criteria that six of the member states and the federal EPA don’t have. Simply relying on the state and federal EPA standards “may not be adequate to protect the aquatic life and uses of the Ohio River,” the dissenting commissioners wrote. I agree with them.

Please commit to keeping the standards in place.

Hello, I heard your committee is considering relinquishing pollution control standards. As a citizen of Cincinnati I would like to strongly oppose the possibility, because not all states have equal ability to set their own standards alone as stipulated by the Clean Water Act. Getting rid of the protective layers would lead to further damage to the Ohio river. Thank you, Laura

Please do not lessen the pollution regulations for the Ohio River. Corporations need to be held accountable to producing a product without harmful health effects.

ORSANCO

5735 Kellogg Avenue

Cincinnati, OH 45230

To the members of the Commission:

Thank you for your work in the past to prevent industrial pollution in our waters. So many people work to make our world a safer place, there will one day be rewards for those jobs. Often now, the work goes unnoticed by us.

I don't know how or why the commission voted to not continue the speciality work they were doing. It could have been funding, more Trumpites came into the group, pressure from lobbying groups, many things.

If ORSANCO standards are more stringent than state or federal standards, I would pray they be continued. Here in WV, we have seen how the turmoil over clean water supplies have been in the coal fields, especially around mountaintop mining. Many people had to buy cisterns and get water from sources away from their area. Our ^{state} EPA has not been able to prevent great contamination. Under present national EPA administration, I cannot imagine federal standards will be strong.

With fracking, one chemical in the water used is benzene, a dangerous cancer-causing chemical. Many chemicals added to the water pumped underground have not been cleared as being safe. When this water is deposited somewhere as wastewater, there must be precautions for contamination of the water supply for our citizens.

Please continue your work monitoring, working with emergency response agencies, and protecting us.

Sincerely,

From: [Nicole Forrester](#)
To: PCS@orsanco.org
Subject: Pollution Control Standards for the Ohio River
Date: Wednesday, July 18, 2018 10:31:14 AM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Dear ORSANCO Commissioners,

From your website: The Ohio River Valley Water Sanitation Commission (ORSANCO), was established on June 30, 1948 to control and abate pollution in the Ohio River Basin. ORSANCO is an interstate commission representing eight states and the federal government. Member states include: Illinois, Indiana, Kentucky, New York, Ohio, Pennsylvania, Virginia, and West Virginia.

ORSANCO operates programs to improve water quality in the Ohio River and its tributaries, including: setting waste water discharge standards; performing biological assessments; monitoring for the chemical and physical properties of the waterways; and conducting special surveys and studies. ORSANCO also coordinates emergency response activities for spills or accidental discharges to the river, and promotes public participation in programs, such as the Ohio River Sweep.

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

My family and I are survivors of the 2014 water crisis, centered in Charleston, WV. I remember seeing ORSANCO trucks with teams checking on the Kanawha River, which flows into the Ohio. I deeply appreciate clean water and all who help keep it so.

Thank you for this opportunity to comment.

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Subject: Pollution Control Standards for the Ohio River
Date: Wednesday, July 18, 2018 2:26:03 PM

Dear ORSANCO Commissioners,

I am a retired chemical engineer and worked for over 25 years in a chemical plant that drew water from and discharged to the Ohio River. I witnessed firsthand the improvement to the water quality of the river as a result of the implementation of the Clean Water Act, much of which happened through ORSANCO.

As an engineer, I found that the concrete guidelines and requirements set by governing bodies like ORSANCO were invaluable in designing pollution control processes and specifying pollution control equipment. We could build facilities with confidence that we were meeting our obligations ... that we could provide goods and services and jobs without sacrificing the environment we lived in ... that we could look our neighbors and children in the eye and tell them we were not sacrificing their well-being.

Over the years, I observed how pollution control technology improved in response to the projected schedule of tougher standards and how river and water quality improved as well. As a technical person, I am proud that technology can and does respond to higher demands. I believe that's what progress is all about ... responding to higher expectations.

As an older person (in my 70s), I have enough life experience to know that when it comes to common resources, like air and water, a uniform approach, with standards that apply to all users, and a governing body able to have a strategic view of future requirements is definitely the way to go. The nature of water is such that if standards are set by user sub-groups, the overall water quality will be determined by the lowest standards. But everyone needs water ... so its quality should be set with everyone in mind. I do have some sympathy for the smaller government philosophy, but I always apply it on a case by case basis. And in this case, the very nature of the subject ... water ... argues for a uniform approach.

Finally, as a citizen and a person, I believe that we should pass on to the future a world that is better than the one we were handed. I want my grandchildren to have a world better than I had. And I think that kind of future is within the grasp of technology improvement, but we do need to make the right decisions today.

One of those right decisions would be to maintain ORSANCO as a strong governing body with uniform standards and a strategic view of future requirements that will make for a world with better water quality.

Thank you for listening.

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Clean drinking water is obviously important to me. I want clean water in rivers and streams so that I can safely enjoy kayaking. I don't want polluted water contaminating agricultural land when streams and rivers overflow their banks as I want uncontaminated food.

I want industries, including agriculture, to be regulated so that they don't contaminate the waters of the US. ORSANCO needs to continue regulating the water sources in the region. The Ohio River still needs to be cleaned up.

Thank you for this opportunity to comment.

West Virginians know two rivers and their tributaries are essential to the health of our state: Ohio and Potomac. The Ohio River can't afford to loose any protection. ORSANCO must not to walk away from their responsibility of improving the Ohio's water quality!

Please continue to set pollution limits. The Ohio is so important for drinking water, for aquatic life, for recreation. It is in greater danger now due to the lessening of restrictions on how extraction industries handle waste. Clean water is our most valuable asset and necessary for life. At some point, it will likely be worth more than gold.

Subject: Pollution Control Standards for the Ohio River
Date: Wednesday, July 18, 2018 4:29:16 PM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

I used to drive along the Naugatuck River in C T. When I first started, it ran red, yellow, brown, or green depending on what was dumped upstream. Ten years later when I moved, the colors were no longer present and plants grew on the river bank. Keep regulations on the Ohio.

Subject: Pollution Control Standards for the Ohio River
Date: Wednesday, July 18, 2018 7:58:31 PM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Subject: Pollution Control Standards for the Ohio River
Date: Wednesday, July 18, 2018 11:46:56 PM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Subject: Public Hearing Comments
Date: Thursday, July 19, 2018 9:44:06 AM

Good morning,

Though I'm unable to attend the public hearing in Erlanger scheduled for July 26th I strongly oppose any deregulations to our water pollution standards. If anything, we need additional regulations as the Ohio River is one of the most polluted rivers in the country. In what way would deregulation in this realm be beneficial to public health and safety?

Please oppose any further deregulation of water pollution standards for our community. Do not sell us out, again, for corporate interests. The Commonwealth cannot handle much more of this.

Thank you for your time,

Rachel Newton,
Florence

Subject: Pollution Control Standards for the Ohio River
Date: Thursday, July 19, 2018 9:53:09 AM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Subject: Ohio river
Date: Thursday, July 19, 2018 2:05:45 PM

Hello. My name is Wade Turner and I live in newburgh Indiana. I read about the plan to leave pollution control for the Ohio river in the hands of individual states. While I agree with the concept of states rights normally, it seems obvious that the Ohio river pollution standards are already to lax. This river should be a natural resource protected and highly regulated. It amazes me that we have allowed the river to get so amazingly polluted already and I believe that removing any pollution regulations my just be the most heartless thing I have ever heard. Do the people pushing for such a ridiculous pollution control standard want everyone living along this river to die from cancer? It seems to me they might.

Thank you
Wade Turner

Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Dear ORSANCO Commissioners,

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River. Your work, and that of many other concerned citizens, has made a big difference. We do not want to lose out now.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.

Please uphold these standards. The public has few who currently act to protect our mutual interests in seeing that our water resources are protected for us and our children and grand children. I live in Northern Kentucky near the Ohio and Licking rivers. Please do all you can to protect these fine resources from those who choose to pollute.

As an Indiana resident, I **do not** support ORANSCO's suggestion that pollution standards be relaxed along the Ohio River. With our country's natural resources under constant assault (especially under the new GOP administration) we must keep current standards in place, if not **improve** them.

I urge ORANSCO to keep these protections for the health of both the citizenry and the environment, rather than catering to those who would take advantage of a lack of oversight to further corporate need and greed.

Sincerely,

Carrie Wild

I grew up on the Ohio River and remember how great the fishing and swimming were. This was the 50's. THEN: the water became filthy and smelly. I guess that is what I am going to see again with the new policies. What a shame.

Grew up along the banks of the Ohio River.

It is vital that ORSANCO continue to set and monitor current pollution levels in tributaries leading to the Ohio River. Ohio River tributaries account for 93% of total pollution found in the river.

To continue to protect the drinking water and health of our citizens, and to provide stewardship to our previous natural resources and environment here in the Commonwealth.

Please continue the vital practice of setting pollutant standards.

Subject: Pollution Control Standards for the Ohio River
Date: Saturday, July 21, 2018 3:31:47 PM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

To the members of ORSANCO and whomever it may concern:

I wish to write to you about the pending decisions to be made regarding the Water Quality Standards and the fate of the Pollution Control Standards Program which are currently under triennial review. I have read the five proposals placed forth by your organization and I believe that options 1 and 2 are highly irresponsible and would be a step backwards for the millions of people living along the Ohio River.

As you are no doubt aware, millions of people rely upon the Ohio River for water, whether it be for drinking, bathing, or growing the food that helps feed our country. As the now four year old crisis in Flint has revealed, we cannot be too stringent in our regulation of our water supply. Whether it be lead, arsenic, sulfur, organic compounds, fertilizer runoff, or any of other countless pollutants we must work to keep our rivers clean and safe to use.

Options 1 and 2, which rely on the EPA and state regulatory agencies to continue the monitoring of the Ohio River is an irresponsible abrogation of duty which I believe ORSANCO should not consider. It is very easy for us to assume, "Well, somebody else will take care of that." To assume that the federal government or the states will pick up the slack and multi-state organizations need not form an additional regulatory capacity. But I think this is a risk we cannot take. It would be all too easy for those other organizations to also conclude, "Well, somebody else will take care of that." and also abrogate their responsibilities.

In a situation of *quis custodiet ipsos custodes* it is vital to have as many custodians watching each other as possible. ORSANCO has served a vital role in regulatory oversight ensuring that state and federal regulations meet or exceed what science has shown to be safe and clean water. I urge you to consider alternatives that continue ORSANCO's regulatory duties and maintain regulation and oversight to protect a resource vital to the lives of us in the heartland of the United States.

Sincerely,

B.A. Klapper

Dear ORSANCO,

It is vital to the health of Kentucky that you continue to enforce pollution regulations in the Ohio River. My family, along with 3 million other people get their drinking water from this river, and 25 million people live in the Ohio River Basin. Do not put us at risk of the countless health issues related to polluted water. In addition, Ohio River tributaries make up 93% of stream and river miles in Kentucky, so even those who don't live in the basin are affected. By discontinuing pollution regulations, you are also endangering Kentucky's natural landscapes and wildlife. These beauties are not easily restored.

Please continue to set and monitor pollutant levels in our river. Don't let Kentucky down.

Very best,
Oli Tierney

I strongly oppose the reduction in standards this is proposed. At a time when EPA standards are constantly under attack, this would be a terrible time to reduce ORSANCO oversight. We need coordinated regional regulations that will protect the Ohio River for all the states and people involved.

ORSANCO and polluters say the standards for the Ohio River are redundant because the states are doing an adequate job of controlling pollution. But Indiana has failed to adopt more than 100 pollution limits in ORSANCO's standards that are more protective for many dangerous chemicals including arsenic, chromium, and methylmercury. ORSANCO-please keep protecting the Ohio River. Thank you.

Date: Monday, July 23, 2018 10:14:45 AM

I want to express my grave concerns about the new ORSANCO draft proposal. This proposal shows whole chapters of pollution control regulations crossed out. For the most part, it guts ORSANCO's role as an agency regulating discharge into the Ohio River. Without ORSANCO's standards all Ohio River states will have to develop their own standards, which may very well lead to interstate litigation as downriver states fight to protect their water quality that might be jeopardized by weaker upriver state standards. They should be working with all the states collaboratively for uniform standards for all water quality standards. In addition, it's critical that ORSANCO fully maintains its role holding the states' and the federal EPA accountable, to maintain high standards of pollution control regulations.

As one of the 5 million people who depend on the Ohio river for their drinking water, I count on ORSANCO to continue to fully work in the defense of our river.

Subject: Keep our plants, animals, and communities safe with high control of pollution standards
Date: Monday, July 23, 2018 4:13:54 PM

Dear ORSANCO,

Since the publishing of “Silent Spring” by Rachel Carson, every day people understand the interconnectedness of all of life and the importance of clean water and clean air. When one vital resource, water, is corrupted by pollution, all of life is negatively impacted and suffers. Medical problems and disease increase. Life expectancy lowers.

For the last year and a half the EPA has been hard at work deregulating industry and businesses. A move that imperils each of us.

Cincinnati has one of the highest incidence of cancer in the nation.

A couple of years ago there was a six mile long algal bloom floating down the Ohio River. Algal blooms are toxic to animal and plant life. Our own drinking water comes from that same river.

ORSANCO must advocate for our communities and keep the pollution control standards the highest possible.

Sincerely,

Beth Sheehan

Hello!

Yes, ORSONCO, talking to you. Guys, what're you doing? You want to stop having restrictions and pollution standards that protect the Ohio River and its tributaries? Would you also like some brains in your skulls? Last time I checked, you all were humans too. You guys need clean water to like, survive and not die of disease because companies are dumping whatever the heck they want into your drinking water. And besides you, there are like 3 million people drinking from the Ohio River. Plus, 25 million people that live in the Ohio River Valley, which is like 10% of the US population. Did you realize your decisions are impacting 10% of the US population? Did you notice that your decision could literally be hurting millions of people?

Also, like, have you seen the Ohio River? It's nasty! I don't want to swim in that water, do you? And you're ready to just allow it to be polluted more? Also, what kind of Sanitation Commission are you if you're not helping keep the Ohio River sanitized? Check yourself. Take a step back a think about that for a second, please. Did you do get that? All right, good, thank you.

I hope you have enjoyed your small moment of enlightenment on this issue and continue to keep it in mind throughout your decision-making processes. I really do appreciate it if you made it this far.

With love,

Hello,

I would like to voice my strong opposition to any relaxing of pollutant standards in the Ohio River. This water flows into the vast majority of Kentucky tributaries and weakened standards or a lack of enforcement could cause serious health problems for myself and my fellow Kentuckians. It could also endanger ecosystems in the area with serious economic and environmental effects. Please continue ensuring the health and safety of our critical water resources by setting and monitoring pollution standards in the Ohio River.

To the Ohio River Valley Water Sanitation Commission:

The Ohio River is already known as the most polluted inland waterway in the country, yet it is the tap water source for five million people. Given those facts, it seems a foolish choice to relax pollution control standards in any way. Please do not relax pollution control standards.

Subject: Public Comment on Proposal to Drop Ohio River Regulations
Date: Tuesday, July 24, 2018 4:22:20 PM

To: Mr. Richard Harrison, Director and others as appropriate

As a resident of Evansville, IN, I would like to voice my disagreement with the commission's proposal to drop pollution control standards for the Ohio River. The Ohio River provides a source of recreation for residents. It also is a source of drinking water for many. As a resident of the area, I am concerned that the Ohio River is already one of the nation's most-polluted waterways. Dropping or lessening pollution control standards set by ORSANCO would not benefit the goal of keeping a clean, safe and usable waterway.

Leaving the states to solely enforce water standards places our waterways at increased risk of pollution. We need to prevent outcomes like those that have occurred in Flint, Michigan and other cities. There are many industries along the Ohio and the potential for increased pollution is high. Trusting the States and the industries to self-regulate is naive at best. Water contamination impacts the health and welfare of all of us in the region. I urge the commission to not approve this proposal and to be vigorous in creating, monitoring and enforcing standards that ensure our waterways remain safe.

Thank you,

Kay Vaught

Subject: Pollution Control Standards for the Ohio River
Date: Tuesday, July 24, 2018 7:06:47 PM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Subject: Ohio River Water Quality
Date: Tuesday, July 24, 2018 7:13:22 PM

Hello,

I am unable to come to the public hearing on 7/26, but would like to ask that ORSANCO keeps its water pollution control program strong. The Ohio gets more pollution than any other river in the United States, and ORSANCO has established critical rules over pollutant release for the last 70 years. These rules have successfully improved Ohio River water quality and kept upstream states from degrading Indiana's water resources. The public should and NEEDS to be able to weigh in on this matter, as the health of our waterways affect us all.

Indiana has failed to adopt more than 100 pollution limits in ORSANCO's standards that are more protective for many dangerous chemicals including arsenic, chromium, and methylmercury. I don't think anyone can argue that ORSANCO's rules are redundant, when the state of IN has proven it is not interested in protecting the health of the Ohio over the greed of polluters. Please do not put control of the Ohio River's future in the hands of the state government, and continue to set rules to protect it from polluters.

Thank you very much,

Eric Mannweiler

PLEASE do not disban ORSANCO!

1. Several states rely on ORSANCO's standards and adopt them as their own. If ORSANCO no longer sets these standards, those states will have to expend the financial resources to develop the requisite standards.
2. ORSANCO should be setting uniform standards with the collective input of all basin states.
3. If all Ohio River states have to develop their own standards, then the situation can lead to interstate conflicts when an upriver state has weaker standards that lead to increased pollution treatment costs for a downriver state. This would, inevitably, lead to litigation among the states.

I teach a class every year at NKU called, Protecting Water Resources, and I have conducted years of aquatic research in the Chesapeake Bay Watershed – I know from first-hand experience the importance of inter-state collaboration! ORSANCO is a great model to students and others on how states can successfully improve the environmental health of a basin, which directly impacts the people that live and recreate there – do not get rid of this important resource for our people!

Not only is ORSANCO integral to the health of our land and people, but it also provides jobs and experiential internships for scientists in the region. And equally important is FORE – one of the educational efforts of ORSANCO. FORE has been teaching students and adults in the region about the importance of clean water and the part that each person plays in their watershed – the work done by FORE would not be replaced by the EPA, etc.

Please reconsider the multi-faceted benefits that ORSANCO provides to the people, environment, and children in the region.

Sincerely,
Kristy Hopfensperger

Subject: Hearing to review Pollution Control Standards
Date: Wednesday, July 25, 2018 1:35:50 PM

To Whom It May Concern,

I am strongly opposed to reducing pollution restrictions in the Ohio River Valley. Removing these restrictions will put us at the mercy of federal regulations which are also in jeopardy with the current administration. We need localized controls to protect our health and the environment that the river-ways support. Please uphold or strengthen the regulations.

Sincerely,

Logan Porter

Subject: Hearing to Review Pollution Control Standards
Date: Wednesday, July 25, 2018 2:10:34 PM

Dear Committee,

I just received notice of the hearing to review pollution control standards. Unfortunately I will not be able to attend on July 26th so I feel obligated to submit my comments via email.

Water is one of the most valuable natural resources available. Water is associated with everything we do and we especially need clean water for showering, cooking, drinking, gardening, etc. I believe the current pollution control program has proven vital for the people of Cincinnati and surrounding areas and it should remain in tact. I fear for the quality of our water if we eliminate ORSANCO regulations and rely solely on Federal regulations. I currently do not trust the Federal regulations as Federal budget cuts are making it increasingly difficult for the regulations to be monitored and ensured. Please let us learn from Flint, Michigan and realize the severity of what is at stake. I will be ashamed if Cincinnati draws similar national attention as Flint, MI due to an elimination of the ORSANCO regulations.

Please keep drinking water an important part of all government discussions and policies. Do not settle for the easy path in terms of policies and standards for healthy drinking water. The more Cincinnati makes drinking water a focus, the more support they will have from the general public.

Thank you for taking the time to read my letter. I look forward to your response.

Sincerely,
Sarah

Subject: Comment on proposed changes to pollution control standards on the Ohio River
Date: Wednesday, July 25, 2018 2:24:11 PM

The Ohio River is already known as the most polluted inland waterway in the country, yet it is the tap water source for five million people, including me and my family.

I strongly disagree that state-level pollution control standards are adequate, for the following reasons:

1. Several states rely on ORSANCO's uniform standards—set by representatives from all member states in the Ohio River watershed—and adopt them as their own. If ORSANCO no longer sets these standards, those states will have to expend the financial resources to develop standards.
2. If all Ohio River states have to develop their own standards, then the situation can lead to interstate conflicts when an upriver state has weaker standards that lead to increased pollution treatment costs for a downriver state. This would, inevitably, lead to litigation among the states, and problems with communication and enforcement of pollution standards.
3. Waste products and leaks from the fracking industry are causing more harmful pollutants to enter the watershed by the day, and this will get worse if the proposed Appalachian Storage Hub gets built.

Please do not relax pollution control standards that impact the water we rely on and drink!

Thank you for the opportunity to comment.

It is incredibly important for ORSANCO to continue to set and monitor pollutant levels in the Ohio River. The health and safety of this river greatly impacts not only surrounding communities in the Ohio River Basin but the entire Commonwealth of Kentucky. **Tributaries of the Ohio River account for 93 percent of the stream and river miles in Kentucky.**

Without strong pollution standards and enforcement of those standards we cannot guarantee the drinking water quality and the recreational and environmental value of this important ecosystem.

Please continue the important practice of setting pollution standards.

I'm appalled at the idea of overturning the current pollution controls on the Ohio River. Clearly the EPA's original laws were not strong enough to begin with, so the ORWSC had to enact something better – keep it that way! Or better yet – make it stronger! With the Ohio river constantly being labeled as one of the dirtiest and most polluted bodies of water year after year, doing away with these regulations would be unconscionable!

While I applaud our water districts for providing some of the top drinking water in the nation, there is no need to make their jobs any harder – or let Big Industry make our river even worse! History shows that Big Industry cannot police itself and with the current administration stripping down the EPA, we as a local governing body, need to watch our for ourselves!

A public hearing on a Thursday night, at dinner time, during the summer, 9 or so miles from downtown, hardly sounds like you are trying hard to work for the people.

Thank you,
Paul Cahill

As a resident of Evansville, Indiana, who relies on the safety of water drawn from the Ohio River, I am writing to ask you NOT to eliminate ORSANCO pollution control standards for the Ohio River Valley! It is NOT true that the states along the Ohio River have standards that will adequately protect the river. There are more than 100 ORSANCO standards that are either missing or weaker in Indiana's standards, and the situation is similar in the other Ohio River states. Each ORSANCO standard is a scientifically derived maximum amount of a chemical the river can have and still be healthy for people and aquatic life.

It is of great importance to me and my family that the Ohio River continue to be kept as free of pollutants as possible.

Thank you.

Sincerely,
Katherine Solecki

Subject: Against Pollutions Control Standard 2018 Revision
Date: Wednesday, July 25, 2018 5:47:09 PM

Hello ORSANCO,

My name is Robert Sikorski and I am writing today (July 25, 2018) to say that, after viewing the webinars and reading the marked up revision available on the ORSANCO website, I am against the proposed revision.

Additionally, I am disappointed by the webinars level of provided information – there is not enough addressing the effective impacts and why these changes are being sought. It is not enough to show me that a table of contents is changing in size, I want to know what the practical impacts over the next three years (range chosen since this appears to be the standard revision cycle) may be, worst case and best case scenarios.

These aren't outrageous expectations, but, if anything, normal expectations for proposing rules changes for projects in business. I don't see why this kind of rules revisions should be any different just because it is in the public sector.

To reiterate, I am against the proposed revision.

Thank you very much for taking the time to receive my public comment.

Sincerely,
Robert Sikorski

Good evening,

I recently heard about this year's review of the pollution control standards last renewed in 2015. The Ohio River is my home (Cincinnati resident), and its protection is paramount to the vitality of its cities. From what I have read, the river's condition has improved greatly since the establishment of ORSANCO in 1948. While national legislation like the Clean Water Act are also contributors, having a local organization expanding on those national guidelines is what makes this improvement possible. Reducing or removing pollution restrictions leaves this body of water that needs local attention at risk for a decline in its health. I do not want our river to be at the whim of a federal agency that has different priorities every 4-8 years. Local agencies know their natural resources best and that is certainly the case here.

Thanks for your time,
-Alex

Hello, I'm writing to give my comments on a proposal to end certain water quality regulations that apply to industries that utilize or are part of the Ohio River and watershed. I do NOT want any of the water quality regulations that apply to industries repealed. The industries that generate pollution need to continue to be held responsible for their wastes and do all they can to uphold the current regulations on pollution mitigation. In an era of record corporate profits, there is certainly no justification for rolling back water quality regulations on polluting industries... on the contrary, businesses are economically positioned well to maintain IF NOT VOLUNTARILY IMPROVE their current compliance with pollution/water quality standards.

Respectfully,

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

I would like to comment on the revision of the Ohio River Valley Water Sanitation Commission's proposed revision to the Pollution Control Standards. After having read the revised document with more than half of the previous standards crossed out. I am deeply concerned about Chapter 3 "Water Quality Criteria" in particular section 3.1 which appears to be striking carcinogenic chemical limits from the list, and section 3.3 Human Health. It appears that the commission is removing any limits to carcinogenic substances from its pollution control policy. This is a very serious act, that will have grave consequences for people depending upon water from the Ohio River. While it may be cheaper to not have to test for such chemicals, the real cost will be in human lives. I have a daughter who is planning on attending the University of Cincinnati in the fall and what carcinogens she may be exposed to is very concerning. Our government should be raising our water quality standards instead of decreasing them. The time to save future generations is now. This is not the time to be short sighted in order to save a few tax dollars.

Yours truly,
Margaret Minneman

Dear Sirs,

It is with great fear that I read about eliminating the pollution control standards for the Ohio River. As Indiana pushes for more industry and industry and industrial mining activities, respect and protection for the water resources are diminishing.

I am not totally familiar with the guidelines of your group; a discussion with environmental groups and interested citizens might help you update and tighten regulations.

Is it safe to eat fish from the river?

Have the Asian Carp infiltrated the river?

Is the Wabash watershed being operated with Best Practices?

How are the Flood plains in the watershed being protected?

Will elimination of pollution control standards jeopardize well waters and aquatic life downstream?

What is done 'upstream' will affect more than the Midwest and more than the waterway itself...Flood ways, Flood plains, & Flood fringes will also be affected.

Sincerely,

Kay Miller

Subject: Pollution Control Standards for the Ohio River
Date: Thursday, July 26, 2018 10:24:30 AM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

We have read with alarm the current proposal to drop uniform pollution control standards for this region. It is obvious that pollution created in one area of the region affects much larger areas than the original site of origin.

Therefore, the need for uniform regulation standards for the entire region should be self-evident. Piecemeal regulations would be confusing and ineffective. The current proposal is nonsensical and detrimental to the health and quality of life in this part of the nation.

Please consider improving the Ohio River pollution standards, not weakening them. I have lived in Cincinnati most all of my life. It's very important to me that our river quality be improved. We have the most polluted river in the entire nation. How is this possible? What can we do to improve this situation?

As you know, several states rely on ORSANCO's standards and adopt them as their own. If ORSANCO no longer sets these standards, those states will have to expend the financial resources to develop the requisite standards. ORSANCO should be setting uniform standards with the collective input of all basin states. If all Ohio River states have to develop their own standards, then the situation can lead to interstate conflicts when an upriver state has weaker standards that lead to increased pollution treatment costs for a downriver state. This would, inevitably, lead to litigation among the states.

I want to go on record to urge the ORSANCO members to vote to continue the work they have been doing to protect the Ohio River valley air and water quality. We cannot allow the air and water quality to degrade to levels from the 1970's. Without constant oversight; I am concerned that industries would operate without concern for the environment and would put financial interests first. Please do not allow this to happen.

Thank you for your work and I urge you to continue.

Subject: Changes to 2015 Pollution Control Standards for Discharges into the Ohio River
Date: Thursday, July 26, 2018 2:13:31 PM

I adamantly REJECT the proposed changes to the polluton standards set Oct. 8, 2015.

The Ohio River Valley Sanitation Commission (ORSANCO) needs the power to maintain sanitary standards and safe drinking water along 900 miles of the Ohio running through Illinois, Indiana, Kentucky, NY, Ohio, Pennsylvania, Virginia and West Virginia. All 8 states need to continue the pollution control that we have achieved so far,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Josephine Irvine-Groves

Dear ORSANCO,

As a CURRENTLY REGISTERED REPUBLICAN VOTER, I am DEEPLY concerned about both air and water quality. Polluted air and water make taxpayers sick, unable to work, unable to pay taxes. It really is simple math. Industry needs to stop pushing the costs of pollution off to health insurance/drug companies.

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. Subject: Protect the Ohio River, Too!
Date: Thursday, July 26, 2018 2:34:32 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Lynn Gedeon

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Philip McPherson

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Rebecca Bralek

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Graham Mitchell

This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Sally Hanley

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

William Jackson

Date: Thursday, July 26, 2018 3:05:06 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Alistair Bradley

Dear ORSANCO,

I urge you to keep the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO) unchanged to safeguard us from the detrimental effects such as methylcyclohexane methanol, a coal washing chemical that leaked into the Elk River for instance or a phosphorus runoff from agricultural processes, municipal sewage, and septic tanks that caused a 700-mile-long algae bloom on the Ohio.

At a time when the federal government is eliminating or weakening critical environmental and public health safeguards, ORSANCO's standards are vital to public health and the environment. Savings that jeopardize public health are unacceptable!

Subject: Protect the Ohio River, Too!
Date: Thursday, July 26, 2018 3:11:40 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Deborah Mack

Subject: Protect the Ohio River, Too!
Date: Thursday, July 26, 2018 3:16:32 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Becky Georgiton

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Christina Hlavaty

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Jody Bernon-Wainer

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Angela Matteson

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Subject: Changes to 2015 Pollution Control Standards for Discharges into the Oho River
Date: Thursday, July 26, 2018 3:56:33 PM
Attachments: [image001.png](#)

I adamantly REJECT the proposed changes to the pollution standards set Oct. 8, 2015.

The Ohio River Valley Sanitation Commission (ORSANCO) needs the power to maintain sanitary standards and safe drinking water along 900 miles of the Ohio running through Illinois, Indiana, Kentucky, NY, Ohio, Pennsylvania, Virginia and West Virginia. All 8 states need to continue the pollution control that we have achieved so far.

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO).

The Ohio River is already the most polluted body of water in the United States. Rolling back pollution standards is the LAST thing we need to be doing. Instead, we need to be strengthening these standards and bringing in industries such as clean renewable energy that will not pollute further.

This weakening of standards is being pushed by the fossil fuel industry, which wants to build a petrochemical hub on the Ohio River, adding even more poisons and toxins. The Ohio River is the source of drinking water for millions of people. We cannot pollute it any further. Instead we need to be cleaning it up. Nor do we need these industries that will exacerbate the climate crisis.

I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. Subject: Protect the Ohio River, Too!
Date: Thursday, July 26, 2018 4:05:43 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Cindy Schneider

Dear ORSANCO,

I write you to remind you that a stitch in time saves nine...in other words, preserving OSANCOs water quality standards is much more prudent than bowing to commercial interests and allowing river pollution. We depend on the Ohio River for drinking water and wildlife survival. I heard it is the most polluted river in the country, can this be true? 60 years of Superfunds must convince you that more money is lost restoring a resource than is gained exploiting and degrading it. The current fashion of abandoning caution to the winds and allowing commercial interests free rein won't last if we are to have any economy or live able environment at all. Thank you and please do the right thing for ALL Ohioans!

Subject: Protect the Ohio River, Too!
Date: Thursday, July 26, 2018 4:12:24 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Jill Brothers

Subject: Please Protect the Ohio River, Too!
Date: Thursday, July 26, 2018 4:13:09 PM

Dear ORSANCO,

I am writing today because I want you to know that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO) and this is why I am asking for the current pollution control standards be maintained. I know that drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

ORSANCO's minority report points out that there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. To me, this is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue which the Ohio River brings to our great state.

As you know, in 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

And in 2015 an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

The federal government seems to be bent on eliminating or weakening environmental and public health safeguards, so it is even more urgent that ORSANCO's pollution control standards remain in place.

ORSANCO's standards are important to public health and the environment which is why they should consider reforming the tri-annual review process into a five-year review process. This would reduce cost, if that's what this is all about.

But please do not eliminate the standards altogether.

Thank you for taking the time to read my letter.

Sincerely,

Ursula Cohrs

Subject: Protect the Ohio River, Too!
Date: Thursday, July 26, 2018 4:23:49 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Vida Bossinas

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

William Montgomery

Dear ORSANCO,

THE WATER STANDARDS THAT PROTECT THE DRINKING WATER FOR MILLIONS OF PEOPLE ARE CRUCIAL FOR EACH MAN, WOMAN AND CHILD WHO WILL BE AFFECTED IF THE STANDARDS ARE MODIFIED. Please help keep Ohio's and America's drinking GREAT!

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. Date: Thursday, July 26, 2018 5:05:42 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Jean Jackson

Subject: Protect the Ohio River, Too!
Date: Thursday, July 26, 2018 5:17:05 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

In the 1950>1960s the Ohio River foamed with patches of scum, oil, etc. WE NEED TO KEEP MOVING FORWARD NOT BACK!!

Sincerely,

Judith Koch

From: [Eileen Crowe](#)
To: PCS@orsanco.org
Subject: de-regulation
Date: Thursday, July 26, 2018 5:28:12 PM

As a resident of Greater Cincinnati, ORSanCo's potential de-regulation greatly concerns me. It's first important to remember that we are talking about 5 million people who rely on the Ohio River for drinking water. The Ohio River itself is already one of the most polluted nationally - do we really want to make it worse?

ORSanCo's standards are above that of the EPA and the Clean Water Act. If ORSanCo de-regulates pollution control standards, that leaves 5 million people's drinking water at the grace of the EPA. I know there's many others who feel this way about the EPA, but I have less than no confidence in *anything* the EPA does these days and I sure don't have any confidence in what they might do with my drinking water. Half of ORSanCo's commissioners have ties to industry. Yet *ninety-seven percent* of Greater Cincinnati residents oppose ORSanCo's de-regulation. This proposal to de-regulate pollution control standards is clearly a result of big money industry with absolutely no regard for the people of Greater Cincinnati and Northern Kentucky as well as the people who live upstream and downstream along the Ohio River.

Please consider the magnitude of the impact this will have on everyone's water and oppose the de-regulation of ORSanCo's pollution control standards.

Thank you.

Eileen Crowe

Subject: Protect the Ohio River, Too!
Date: Thursday, July 26, 2018 5:31:02 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Jason Beam

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. It is incredibly important for ORSANCO to continue to set and monitor pollutant levels in the Ohio River. The health and safety of this river greatly impact not only surrounding communities in the Ohio River Basin but the entire Commonwealth of Kentucky. **Tributaries of the Ohio River account for 93 percent of the stream and river miles in Kentucky.**

Without strong pollution standards and enforcement of those standards, we cannot guarantee the drinking water quality and the recreational and environmental value of this important ecosystem.

Please continue the important practice of setting pollution standards.

Sincerely,
Drew Bohl

They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Grace Eder

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Jennifer Hill

Subject: Protect the Ohio River, Too!
Date: Thursday, July 26, 2018 6:55:00 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Christine Hurst

I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Sean Browning

Subject: Protect the Ohio River, Too!
Date: Thursday, July 26, 2018 7:32:28 PM

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Jeffrey Mccollim

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

To: PCS@orsanco.org
Subject: Pollution Control Standards for the Ohio River
Date: Thursday, July 26, 2018 8:31:39 PM

Dear ORSANCO Commissioners,

Since 1948 ORSANCO has set pollution control standards for the Ohio River. These standards have helped improve the water quality of the river and provide critical guidance to the eight states within the basin. Please don't walk away from your responsibility to set uniform pollution control standards for the Ohio River.

Please consider the following comments as you determine ORSANCO's future role.

1. There will be protection gaps and inconsistencies. A 2015 survey conducted by ORSANCO comparing state water quality standards to ORSANCO's pollution control standards found a total of 440 pollutants where there are no state water quality standards or ORSANCO's standards are more protective than the states.
2. States will have added burden. States depend on ORSANCO to establish numeric criteria for toxins like copper, cyanide, fluoride, methylmercury, and nitrites. Without ORSANCO's pollution control standards, states would be burdened with the financial responsibility of researching, developing, and establishing numeric criteria for gaps in state standards.
3. Downstream states stand to pay the price. A state-by-state approach to setting water quality standards raises concerns related to interstate conflict. Without uniform standards for the Ohio River, an upriver state could develop weak water quality standards that would lead to pollution related issues for downriver states.
4. It's a step backward in cleaning up the Ohio River. ORSANCO's pollution control standards are set to manage the Ohio River basin as a whole, rather than disjointed river segments. States should be able to count on ORSANCO to set uniform pollution control standards that bring the entire Ohio River closer to meeting the Clean Water Act's key tenants of fishable, swimmable, and drinkable.

Thank you for this opportunity to comment.

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

James Wiesner

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

K.K. R-Shaw

Dear ORSANCO,

I am writing today to tell you that I value the water pollution control standards set by the Ohio River Valley Water and Sanitation Commission (ORSANCO). I am not alone asking for the current pollution control standards be maintained, drinking water authorities and utilities are on my side. They also understand the value of ORSANCO setting uniform standards to protect the drinking water of 5 million people.

According to ORSANCO's minority report, there are 188 parameter criteria which the six signatory states and the US Environmental Protection Agency lack. This is a clear indication that ORSANCO's standards must remain in place to protect our drinking water, recreational opportunity and tourist revenue that the Ohio River brings to our great state.

In 2014, methylcyclohexane methanol, a coal washing chemical leaked into the Elk River and traveled into the Ohio River.

In 2015, an overabundance of phosphorus runoff from agricultural processes, municipal sewage, and septic tanks in the watershed caused a 700-mile-long algae bloom on the river.

At a time when the federal government is eliminating or weakening environmental and public health safeguards it is even more urgent that ORSANCO's pollution control standards remain in place. Considering the importance of ORSANCO's standards to public health and the environment, they should consider reforming the tri-annual review process into a five-year review process in order to reduce cost, not eliminate the standards altogether.

Sincerely,

Chico Converse
